# Acknowledgments

This technical report of NASA 2017 conducted by ERO for Grade 8 in Mathematics, Nepali and Science has been prepared to describe and communicate the theory, methods and process used in designing, developing and conducting the assessment. It presents the details of technical aspects including designing, development and administration of assessment; data preparation and parameters estimation; equating and analysing; and reporting of assessment results. A separate public report of NASA 2017 has been prepared on the results and findings which will provide useful information on the achievement of students for Grade 8 in Mathematics, Nepali and Science in Nepal with a number of variables including province, gender, home language, ethnicity, socioeconomic status, school types, leisure time and activities in the leisure time at school, attitude towards teacher and school, school bullying, availability of textbooks, and activities at home.

This is the product of a collaborative effort of several agencies and individuals including teachers and experts. I acknowledge the collaboration and dedication of experts, Subject Committee members, and Assessment Committee members in designing this assessment and supporting for the reporting. I also acknowledge the head teachers/principals, teachers and students who participated in the assessment. I also thank the test administrators, District Education Officers and other officers from DEOs, and Dr Peshal Khanal, team leader for administrating, scoring and preparing data on behalf of Centre for Educational Research and Social Development (CERSOD).

I highly appreciate the contribution of Dr Binod Luitel and Dr Prem Phyak who not only worked for language editing of the report, but also provided inputs for data analysis and preparation of this technical report. My thanks go to the technical officers from ERO including Shyam Prasad Acharya, Devi Ram Acharya, Lav Dev Bhatta and Ram Chandra Dhakal for analysing data and contributing for preparation of this report; to Under Secretary of ERO Rudra Adhikari for overall coordination and facilitation during the processes of assessment; to Under Secretary Prahlad Aryal for coordinating the activities during the administration and data preparation phase; to Under Secretary Hem Raj Pokharel for coordinating the activities during the analysis phase and Section Officer Prakash Kharel and Account Officer Nagedra Dahal for facilitating during the planning and administration of the assessment. My thanks are also due to the entire staff of ERO who supported for

conducting this assessment as and when required and the personnel from various Central Level Agencies of MOE and the Ministry of Education who contributed for monitoring test administration. I also acknowledge the World Bank and the Australia Council for Educational Research, India for their technical support to ERO for the training on large-scale assessment and its data analysis.

**Dr Lekha Nath Poudel**

# **National Assessment of Student Achievement: An Introduction**

## **1.1 Introduction**

National Assessment of Student Achievement (NASA) is conducted to identify the existing status of students' learning achievement in different subjects throughout the country. The goal of NASA is not to compare the students' results at individual level. Rather, it aims to provide the Ministry of Education and other concerned stakeholders with insights for understanding the current status of the students' achievement, and to suggest policy recommendations for improving the students' overall learning achievement. Administered among the representative sample of students, national assessments are designed to assess students' achievement across content and cognitive domains in each subject.

This report provides technical details of NASA, 2017 and describes the overall technical aspects of NASA 2017 cycle from assessment design to report preparation. It includes the process, methods and tools adopted in developing assessment framework for NASA 2017, test design, development of items and questionnaires, piloting and selection of test items, preparation of test and questionnaire booklets, administration of tests and questionnaires, scoring and data entry, item parameters estimation and equating, data analysis, and report preparation.

This chapter provides a general overview of the NASA 2017 for Grade 8 in Mathematics, Nepali and Science. More specifically, it includes the context of NASA, a brief introduction to NASA 2017, use of item response theory and outline of the report.

## **1.2 Context**

The Government of Nepal established Education Review Office (ERO) in 2010 as an agency for carrying out research on assessment and other educational issues to support the government in its efforts to reform school level education. Before the establishment

of ERO, some assessment studies were carried out at national level by external agencies. These assessments (conducted between 1995 and 2010) were based on the Classical Test Theory (CTT). ERO has been conducting National Assessment of Student Achievement (NASA) in various Grades and subjects of school education since 2011 (see ERO, 2013; 2015; 2015a; 2016). It has already carried out two rounds of NASA for the students of Grades 3, 5 and 8.

ERO has used the Item Response Theory (IRT), instead of CTT, in selecting test items and analyzing the assessment results. This theory is helpful to compare different versions of tests by calibrating the items and comparing between the results of assessment in different years. However, the use of norm-referenced test (NRT) and the analysis of results without defining the proficiency level have some limitations to make assessment results fully comparable across the years. In order to develop criterion-referenced test (CRT) for this assessment, ERO has defined criteria and standards to be achieved by the students of Grade 8 and specified the proficiency levels of the students in each of the assessed subjects.

As recommended in School Sector Development Plan (SSDP) prepared by the government of Nepal, ERO has conducted NASA for Grade 8 in 2017 and has a plan to conduct NASA for Grade 5 and Grade 10 in 2018 and 2019, respectively. ERO has used and will be using the Item Response Theory (IRT) for these assessments to compare test results across the years, test versions as well as similar types of international assessments. The major departure from the previous assessments, conducted by ERO, to this assessment of Grade 8 is the use of criteria and standards-referenced assessment, instead of norm-referenced assessment. Similarly, this assessment has used a scale score instead of percentage in reporting the students' proficiency towards making the results comparable and explaining the students' latent traits with the help of the score in relation to the characteristics of items. In addition, the assessment framework (Pant, Singh and Poudel, 2016a) has been developed as the guiding document of the entire assessment process, to make the national assessment more valid and reliable. The use of sampling weights to estimate the generalizability of test scores to the entire population has been another step followed in this assessment.

For the first time, ERO is publishing two reports — technical and public. The technical

report includes the details of the process and activities in design and administration of the test, and analysis of the assessment results. On the other hand, the public report generally includes the assessment results without adding the details of technical aspects of the assessment. The two versions of reports have been prepared to make NASA results accessible to all educational stakeholders including policy makers, general public, programme developers, implementers and educational researchers. The agencies and individuals that may not be interested in technical details (but are rather interested in the synopsis of the major results only) can study the public report, while researchers and the agencies that are interested in technical details could consider reading the technical report.

### **1.3 National Assessment of Student Achievement**

Since 2011, ERO has been conducting NASA to study and report on student achievement in various grades within a certain time interval. It has already completed two rounds of NASA for the students of Grades 3, 5 and 8. Now, ERO has been administered NASA for Grade 8 students to assess their achievements in Mathematics, Nepali (reading and writing) and Science subjects, and has planned to conduct NASA in Grade 5 and 10 in 2018 and 2019 respectively. As in the previous NASA studies, NASA 2017 is also a sample-based assessment, but the sample weights have been used for reporting the results by estimating the achievement of the entire student population of the grade.

NASA studies are “designed to describe the achievement of students in a curriculum area aggregated to provide an estimate of the achievement level in education system as a whole at a particular age or grade level” (Greaney & Kellaghan, 2007, p. 7). More specifically, such assessments have been conducted to audit the effectiveness of the entire national education system and provide information to the policy makers regarding the existing status of the educational attainment. Furthermore, such assessments aim to inform the policy-making process towards improving the quality of and equity in education.

Looking at the overall purpose of national assessments, the following were the objectives of NASA 2017:

- a. To point out the current achievement level of Grade 8 students in Mathematics, Nepali and Science;

- b. To determine the variations in student achievement by gender, province, school types, ethnicity, home language, socio-economic status and so on;
- c. To explore factors that influence student achievement;
- d. To generate baseline data for the future for comparing and monitoring the progress of students towards student achievement in assessed subjects;
- e. To develop the capacity of education system in conducting national assessments; and
- f. To provide recommendations for policy making towards improving quality of and equity in school education.

Although NASA 2017 is a curriculum-based assessment, curricular competencies have been redefined and made more specific in the assessment framework. In addition, the assessment criteria have been further defined, based on the curricular competencies mentioned in the national curriculum framework; and each criterion are elaborated in six standards— from 'pre-basic' to 'advanced' (see Pant, Singh & Poudel, 2016a). For NASA 2017, test items have been developed and selected considering these six standards in each criterion to make the assessment representative of various levels of standard (proficiencies).

As the purpose of this assessment is to provide feedback to the entire education system for improving the quality of and equity in school education, this assessment does not report individual students' performance, nor does it compare the proficiency of an individual school against others. Similarly, students' individual scores are not made public in any form of identification. It provides the national and provincial results as well as differences in achievement scores due to the various influencing factors such as socioeconomic status, home language, gender, ethnicity, and home and school related factors.

#### **1.4 Use of Item Response Theory**

NASA 2017 has used IRT modelling to select items for the test and to generate data from the test. The scores generated through the IRT modelling are not the raw scores of the students; rather, they represent each student's ability in relation to a particular item and its characteristics. Chalmers (2012) states that IRT modelling provides “a general framework for specifying the functional relationship between a respondent's underlying latent trait level (commonly known as ‘ability’ in educational testing...) and an item level stimulus.”

Using this probabilistic model, NASA 2017 has estimated each student's trait level from their responses to individual items in relation to the characteristics of the test items.

One major feature of IRT modelling is that it has sample-independent item characteristics, and it gives test-independent scores of each student (latent trait). Besides, there are two other assumptions of IRT. First, the test items collectively measure a unique underlying latent trait for each student; and that (only one) latent trait influences the item responses (known as unidimensionality). Second, if the assumption of unidimensionality is ensured, the response of a student to one item will be independent of his or her response to another item – which is called local independence (Le, 2013).

With this understanding about IRT, ERO has used the IRT modelling for item selection, item calibration and equating and estimating students' ability (latent traits-theta value). The equating was done by using some linking items and their parameters between different item booklets, and comparing the test results of different years as well as with other similar assessments. In addition, NASA 2017 used Conquest software for IRT modelling. Along with Conquest, Excel and SPSS (SPSS 23) were also simultaneously used for data analysis and results preparation.

## **1.5 Structure of Technical Report**

The technical report provides a portrayal of National Assessment of Student Achievement (NASA) 2017 conducted at Grade 8 in three subjects: Mathematics, Nepali and Science. This technical report is presented in 12 chapters. Chapter 1 introduces national assessment in general and NASA 2017 conducted by ERO for Grade 8 students of the schools in Nepal in particular. It also introduces and justifies the assessment theories and models, including the Item Response Theory (IRT), as used in this assessment.

Chapter 2 of this report presents the details about the sampling done for this assessment. It identifies sampling frame, and defines population for assessment together with the desired population, exclusions and defined population. This chapter also defines strata for the sampling and describes the sampling process and methods for selecting schools (clusters) and students within the school. Finally, it specifies the number of sampled schools and students in each stratum (province) in each subject.

Chapter 3 describes test design and development of assessment, and assessment methods, process and tools used. It summaries assessment framework, classifies cognitive domain, and describes the activities and processes used for item development, piloting, item analysis and items selection, item booklet preparation, marking scheme preparation, OMR sheet design and item register preparation. Chapter 4 presents the framework for preparing students' background questionnaire, teachers' questionnaire and head teachers' questionnaire. Similarly, this chapter includes a framework for preparing attitude survey questionnaire for students towards the subject and teacher.

Chapter 5 elaborates in detail the test administration process at schools. It describes the process and activities carried out in different stages of test administration such as printing, packing and delivery of tools, orientation about the test administration process to district focal persons and head teachers and teachers responsible for administrating the test, process of administering the tests and questionnaires, collection of the responses from students in the tests and questionnaires, and the monitoring test administration. Chapter 6 presents the selection and orientation of scorers, process of marking, writing responses and marks in OMR sheet, scanning of OMR sheets, and preparing data files.

Chapter 7 describes how the data were prepared for analysis. It explains the data cleaning and code book preparation process. Chapter 8 describes the method and process of calculating sample weights of school and students, and then it presents some examples of calculated weights.

Chapter 9 explains the method and process of estimating item parameters, item review with test-by-test analysis and calibration and equating of items in different versions of test with the lists of estimated parameters, selected and discarded items with their characteristics. It also describes the process of estimating cases – students' ability in each subject, presenting example of case estimation output using WLE method. Chapter 10 describes the method and process of replicating the sample weights for the estimation of population by calculating Plausible values (PVs) and using regression model. It also describes how standard errors were estimated while estimating results for the population.

Chapter 11 describes the method and process of estimating students' abilities in a scale score by transforming logit values to a scale score of students' ability. It also elaborates how the logit values are transformed to a scale score and how various proficiency bands

have been defined and how students are categorized into those levels of proficiency in this assessment.

Chapter 12, the final chapter of this technical report, briefly presents the categories in which the students' results have been prepared for reporting. First, the overall basic results of different provinces will be reported. Then the results based on several influential factors from the background information questionnaire of students will be presented. Finally, it describes how provincial results in different categories will be prepared. Tables of some of the results are included in the annex of this report, while the presentation and discussion of results will be presented separately in a public report of NASA 2017.

## **CHAPTER 2**

# **Sampling**

### **2.1 Introduction**

This chapter includes the sampling procedure adopted for NASA 2017 study. It provides information regarding the desired population, sampling frame, sample size, and sample design. The chapter also discusses the process of selecting schools and students for NASA 2017. It also describes the process of calculating the sampling weights of schools and students.

### **2.2 Population**

The population for this assessment covers all students enrolled at Grade eight in the schools of Nepal. Therefore, schools are the primary sampling units (PSUs) for selecting the students for this assessment.

#### **Desired population**

The desired population for this assessment includes all Grade 8 students enrolled in the schools of Nepal for the academic session 2016/17. All the students from both public and private schools are considered as desired population. The total desired population for this assessment was about 582,637 Grade 8 students from 14,635 schools of Nepal. However, some schools and students were excluded due to some reasons and thus the defined (actual) population of schools and the students considered for the assessment are a little lower than the targeted or desired population. The school names and number of student from each school were received from the Department of Education (DOE). Based on the data from the DOE, Education Review Office (ERO) has defined the population by specifying the exclusions of some participants from the whole population.

#### **Exclusions and defined population**

The difference between the desired and defined population is natural due to some

constraints associated with the desired population to participate in the assessment process. Some of the major causes for the variation in the defined population from the desired population are as follows:

- Some Grade 8 students who were unable to respond to test items and survey questionnaire because of their physical and intellectual disability have not been included;
- Some students from very isolated and remote settlements were not included in the assessment, as the cost required for assessment was very high;
- Some schools do not run Grade 8 and/or have less than five students in Grade eight. Such schools were not included in the assessment.

The following table (Table 2.1) shows the school level (very small schools; or schools with no student; or schools of remote areas) and student level exclusions due to various reasons. The table also shows the difference between the desired (targeted/total) population and defined population for the assessment in seven provinces.

***Table 2.1: Estimation of schools' and students' exclusions; and the desired and defined population***

Province	Total (desired) schools	School Level Exclusions	Defined School	Total (Desired) students	Student level exclusions	Defined Student population	Percentage
1	2754	81	2673	101598	89	101509	17.44%
2	1021	14	1007	74779	76	74703	12.83%
3	3800	126	3674	125811	110	125701	21.59%
4	1799	60	1739	61350	40	61310	10.53%
5	2308	76	2232	107937	89	107848	18.52%
6	1283	208	1075	46021	24	45997	7.90%
7	1670	62	1608	65177	67	65110	11.18%
Total	14635	627	14008	582673	495	582178	100%

The population not included in the assessment is estimated, and attempt has been made to ensure the exclusion of students as minimum as possible to make the defined population as close as the desired population. Table 2.2 presents the defined population (schools and students) and population distribution in public and private schools.

**Table 2.2: Defined population for NASA 2017**

Province	Number of Schools			Number of Students		
	Public	Private	Total	Public	Private	Total
1	2098	575	2673	83244	18265	101509
2	957	50	1007	72660	2043	74703
3	2284	1390	3674	80163	45538	125701
4	1317	422	1739	47549	13761	61310
5	1675	557	2232	85929	21919	107848
6	1048	27	1075	45206	791	45997
7	1505	103	1608	62054	3056	65110
Total	10884	3124	14008	476805	105373	582178

### 2.3 Sampling Frame

The list of all schools to be included in the assessment, with their unique ID (school EMIS code) provided by DOE, is considered as the sampling frame. In addition to the name, location (provincial, district, geography and municipality/VDC) and ID (code) of each school, public and private categories, the total number of students, with gender categories, in each school are taken as the sampling frame. These data are available from the flash report of DOE, which are collected through the national census study of schools every year. The sampling frame for this assessment prepared on the basis of the school data of 2017. However, there can be some changes in the school data each year.

### 2.4 Sample Size

Educational survey research studies suggest that the sampling precision requirements should be such that they would be satisfied by a simple random sample (SRS) of 400 students for the main criterion variable. This size of simple random sample of student yields 95% of confidence interval for the student-level estimate with 3% of confidence interval (Margin error). However, a perfect random sampling is not an easy task in a large-scale national assessment. The sampling design includes the combination of different sampling techniques in different stages, including stratification, clustering and random selection of students. For this, the design effect due to the multi-stage sampling has to be

calculated and adjusted while selecting the sample size.

The following mathematical equations have been used to estimate the sample size of students using a multi-stage sampling, considering the relationships between simple random sample and multi-stage sampling methods.

$n_c = n^* \times \text{deff}$ , where  $n_c$  is the required sample size,  $n^*$  is the effective sample size for simple random sampling (srs), and Deff is the design effect.

$\text{Diff} = 1 + (C - 1)\rho\rho$ , where  $C$  is the population size,  $\rho\rho$  (Rho) = Intraclass correlation.

Putting the value of design effect,  $\text{Deff} = 10$ , as a multi-stage cluster sampling at the national level might have a design effect of 10 or higher (Murphy & Schulz, 2006), the minimum sample size of students is estimated as:

$$n_c = 400 \times 10 = 4000$$

For reporting the assessment at national level, the sample size above 4000 students will be sufficient. However, this study has included the bigger size of sample as reporting and comparison between the test results of seven strata (province) has been planned and carried out. Calculation of the samples of each province has given the national targeted sample size of 16000 students and 650 schools for each subject.

However, the design effect within the province was not as high as the national sample – as the population within the province is relatively more homogeneous than the national population. In this case, while drawing the sample from each province a minimum of 180 schools (60 schools per subject) and 4500 students (1500 students per subject) were selected from each province. Similarly, the samples from the provinces were selected in such a way that the province with relatively higher population will have bigger sample size.

## 2.5 Sample Design

The sample design for NASA 2017 in Grade 8 was a multi-stage sampling which included the selection of schools from each explicit stratum (province). The sampling design was developed by considering the group of districts having the similar ecological/geographical locations within each stratum (province). The geographical locations were

identified by considering district as a unit in the province. The selection of districts from each geographical location is done randomly within the similar geographical categories. The Primary Sampling Unit (PSU), schools (clusters), were selected within the district by using random sampling method; and the students from each of the sampled schools were selected randomly.

### **Stratification**

Stratification is a process of classifying schools into similar groups, according to some defined characteristics or selected variables. The selected variables for stratification are known as stratification variables. As in PISA 2015, this assessment has used stratification process with the following objectives (see, OECD, 2016):

- To make the survey estimates more reliable by improving the efficiency of the sample design;
- To represent specific locations, groups in the sample; and
- To include all parts of a population in the sample.

All schools were divided into seven provinces to make strata explicit. Within the province, districts were classified under various geographical locations/regions, if applicable; and districts from each geographical stratum were selected for NASA 2017. As the implicit stratification, public and private schools were grouped separately in each district to ensure adequate samples from both private and public schools.

***Table 2.3: Provincial and geographical distribution of districts in Nepal***

Province	Mountain District	Hill District	Tarai District	Kathmandu Valley District	Total number of district
1	Sankhuwasabha, Solukhumbu, Taplejung,	Bhojpur, Dhankuta, Ilam, Khotang, Okhaldhunga, Panchthar, Terhathum, Udayapur	Jhapa, Morang, Sunsari		14

Province	Mountain District	Hill District	Tarai District	Kathmandu Valley District	Total number of district
2			Bara, Dhanusa, Mahottari, Parsa, Rautahat, Saptari, Sarlahi, Sirha,		8
3	Dolaka, Rasuwa, Sindhupalchok	Dhading, Kavrepalanchok, Nuwakot, Ramechhap, Sindhuli,	Chitwan, Makawanpur	Bhaktapur, Kathmandu, Lalitpur	13
4	Manang, Mustang	Bablung, Gorkha, Kaski, Lamjung, Myagdi, Parbat, Syanja, Tanahu	Nawalparasi (east)		11
5		Arghakhanchi, Gulmi, Palpa, Pyuthan, Rolpa, Rukum (east)	Banke, Bardiya, Dang, Kapilbastu, Nawalparasi (west), Rupandehi		12
6	Dolpa, Jumla, Humla, Kalikot, Mugu	Dailekh, Jajarkot, Rukum (west), Salyan,	Surkhet		10
7	Bhajhang, Bajura	Achham, Baitadi, Dadeldhura, Darchula, Doti	Kanchanapur, Kailali		9
	15	36	23	3	77

After dividing the whole population into seven strata-provinces and the districts of

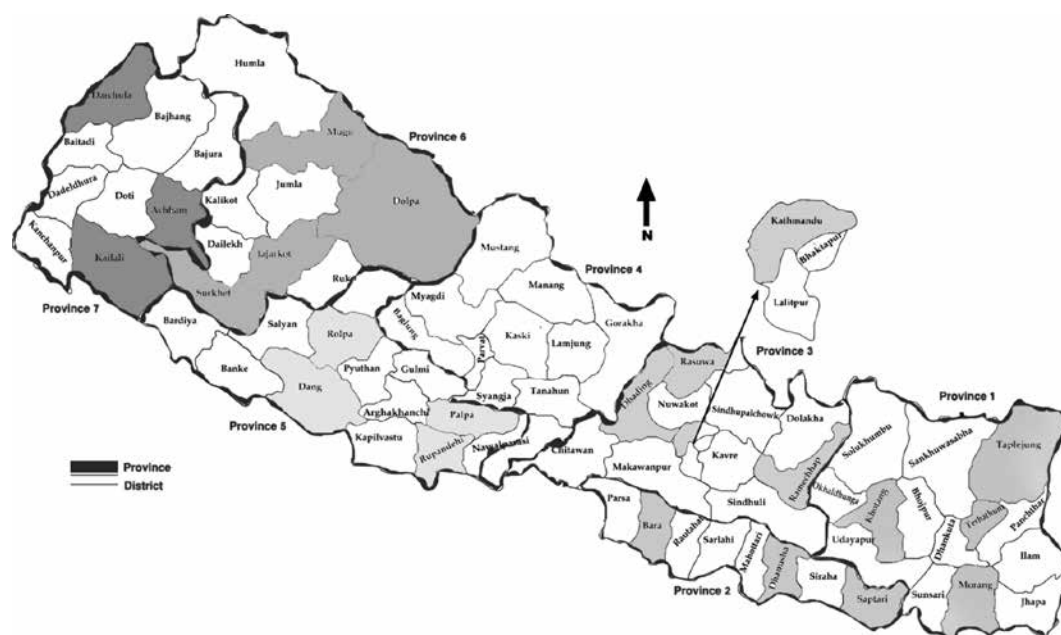

similar geography (Mountain, Hill, Tarai and Kathmandu Valley) within the province, the districts from each stratum were selected randomly. For the selection of the district, the total number of districts (Note that 75 were considered initially when sample was designed, but latter when 77 districts were formed we have adjusted accordingly.) was divided into three groups, having almost the same number of districts in each group. With this, 26 districts were selected for NASA 2017. The grouping of districts into 3 groups of similar categories helped to reduce the administrative burden and the cost, compared to selecting the sample schools from each district. There were two purposes of selecting the districts from each province before selecting the sample schools. First, it helped to select schools from every geographical region of the province. Second, it facilitated the test administration process. When sample was designed for this study in 2016, there were 75 districts in Nepal, so 26 districts were selected among 75 districts. Latter, in 2017 government decided to form 77 districts by splitting each of Nawalparasi and Rukum districts into two districts, and then the sample districts were adjusted accordingly. After this adjustment, 77 districts were counted and included in this report. The data collected from the sample schools and students were reported at the national and province levels.

***Table 2.4: Name of the districts selected for NASA 2017 in each province***

Province	Number of district	Name of the districts	Number of schools sampled	No. of schools per subject	Number of students sampled	No. of students sampled per subject
1	4	Taplejung, Khotang, Terhathum, Morang	296	Math 100 Nepali 98 Science 98	6914	Math 2329 Nepali 2305 Science 2280

**Figure 2.1: Population strata and sample districts**

### **Selection of schools**

As the primary sampling unit (PSU), schools in each province were selected from the sample districts. A minimum of 60 schools and 1500 students were selected from each province for each subject with a higher number of sample schools and students from the provinces having high number of students. School selection within a district was done by using a random sampling method, by sorting out the list of schools from the selected districts. The schools were selected by sorting out the list of public and private schools by maintaining the implicit strata by the type of schools (public and private). Using the same process, the schools from all 26 districts were selected. In addition to preparing the list of sample schools, a list of replacement schools was also prepared. During the orientation programme about NASA administration to the district focal persons, the final list of the sample schools was prepared, choosing the schools from the list of replacement schools, if required.

### **Selection of students**

The minimum sample for the province, having the smallest number of student population, was fixed to be 1500 per subject with 60 clusters (sample schools), adjusting some design effect. Viewing the different sizes of schools, the maximum sample size was fixed 28, which is called Measure of Size (MOS).

In the case of a sample school having more than 28 students, the students were selected by using a random sampling method whereas all the students were taken as samples from the schools with 28 or less students in Grade 8. More specifically, the students were sampled in each of the selected schools in two different ways: (i) If the size of the students is less than or equal to the expected sample size (MOS), all the students were sampled. (ii) When the size of the students was greater than the expected size, the required number of the students was selected randomly. This selection process has given different probability of selecting schools, based on the school size; however, the probability of selection of a particular student from schools is always the same.

The number of sample schools and students presented in the tables 2.1 and 2.2 were the total number of schools and students for three subjects: Mathematics, Science and Nepali. The total sample schools and students were distributed almost equally to each subject. At

least 650 schools and 16000 students were included as samples for each subject. However, some small variations were noticed when actual administration of NASA was carried out.

When actual administration of tests was carried out, some deviations were noticed in the participation of schools and students. Table 2.5 presents the targeted sample and achieved sample in each province and sample districts.

**Table 2.5: Targeted and achieved sampled schools and students in each stratum**

Stratum/ Province	Schools				Students			
	Desired schools	Defined schools	Sample schools	Achieved schools	Desired population (students)	Defined population (Students)	Sample students	Achieved students
1	2754	2673	296	296	101598	101509	6914	6826
2	1021	1007	223	223	74779	74703	6244	5942
3	3800	3674	372	372	125811	125701	8958	8952
4	1799	1739	262	262	61350	61310	5654	5449

## **Test Design and Development**

### **3.1 Introduction**

Education Review Office (ERO) conducted NASA 2017 for Grade 8 in three subjects: Mathematics, Nepali language and Science. The focus of the assessment was to assess the basic curricular competencies of Grade 8 students. In order to guide the test design and development process, a NASA framework was developed based on the curriculum approved by the Government of Nepal. Based on the framework, test items were designed and developed.

This chapter describes the assessment framework for Grade 8 in Mathematics, Nepali and Science; various cognitive domains to be assessed; method and process for item development and item booklet preparation; development of scoring key; and designing of OMR sheet.

### **3.2 Assessment Framework**

The assessment framework was developed before designing the test and developing the test items. The assessment framework was developed to:

Provide a clear guideline for a sound assessment approach to inform policy makers and the other concerned stakeholders on quality of education. It includes domains to be assessed, the statement of criteria together with standards, specification of items, framework for contextual variables to be considered while conducting an assessment and brief guidelines for assessment design. (ERO, 2017)

The assessment framework has identified and described the domains and constructs to be assessed in Mathematics, Nepali and Science subjects. It has also proposed a framework for designing background questionnaires for students, teachers and head teachers. In addition, it has presented a brief guideline on overall methodological approach for the assessment.

## **Framework for Mathematics**

The framework for mathematics begins with the overall objectives of teaching mathematics in school, as specified in the national curriculum framework. As stated in the curriculum, the overall objectives of teaching mathematics are to develop students' basic knowledge and understanding in the use of number and mathematical operations; to equip them with basic mathematical and numeracy skills required for solving daily life problems; and to lay foundations for higher and technical education in various fields (CDC, 2013). Besides, the framework builds on the assumption of the curriculum that “mathematics helps students develop critical analysis of problems and situations and enhance their creativity and problem-solving skills” (ERO, 2017).

Building on the above mentioned overall objectives of mathematics teaching at basic level, the framework considers mathematics as an important part of literacy, which generally includes basic mathematical contents and skills including numeracy, arithmetic, geometric shapes and measurement, algebra, sets and data handling in real life contexts, solution of familiar and unfamiliar problems, and decision-making and communication skills (ERO, 2017). After defining mathematics literacy and stating the overall objectives of mathematics teaching at basic school education, the framework analyses the curriculum of Grade 6 to 8 in mathematics. The following are the general competencies specified for basic level mathematics (Grades 6 - 8), as mentioned in national curriculum (CDC, 2012).

1. Construct geometric figures and verify their simple relations;
2. Develop geometric models;
3. Solve simple daily problems on arithmetic;
4. Collect and present data and communicate simple results;
5. Solve simple daily problems using sets; and
6. Develop problem-solving skills on algebraic expressions and equations.

The curriculum elaborates these general types of competencies in each Grade in order for making them more specific. The following are the competencies set by the Grade 8 curriculum for mathematics (CDC, 2012):

1. Verify and apply the properties of adjacent angles and vertically opposite angles;
2. Investigate the relationship between corresponding, alternate and co-interior angles

formed by a transversal with parallels lines;

3. Investigate and verify the angle sum property of a triangle (the sum of interior angles of a triangle is  $180^\circ$ ) and the properties of isosceles and equilateral triangles;
4. Verify and use the properties of parallelograms, squares and rectangles;
5. Construct regular polygons (pentagon, hexagon and octagon) and rectangles;
6. State and show the conditions of congruency and similarity of triangles and solve the problems related to similarity of triangles;
7. Investigate the relation between diameter and circumference of a circle, and derive and use the formula for area of a circle;
8. Describe the properties of solids (cube, cuboids, tetrahedron, cone, cylinders, prism and pyramids), and prepare nets of cubes, cuboids, tetrahedrons, cones and cylinders;
9. Define Pythagoras theorem and apply it to find the distance between two points;
10. Find the area of triangles and quadrilaterals by using formulae;
11. Solve the problems related to the area and volume of cubes and cuboids;
12. Reflect, rotate and translate a geometric object by using co-ordinates;
13. Identify the location of an object using bearing; draw a scaled figure and calculate distance by using scale drawings;
14. Simplify the integers with brackets;
15. Convert binary and quinary numbers into decimal numbers and vice versa;
16. Define the real number system and differentiate between decimal and irrational numbers;
17. Express the numbers in a scientific notation;
18. Solve problems related to ratio, proportion and percentage;
19. Solve problems related to profit and loss involving discount and VAT;
20. Solve simple problems by using a unitary method;
21. Solve simple problems related to simple interest;
22. Find the median, mode and range from individual data, and draw a pie chart and line graph;
23. Find the difference of sets and complement of a set, and solve simple verbal problems by using Venn-diagrams;

24. Factorise algebraic expressions of the form of  $a^2 - b^2$ , perfect square trinomial, trinomial of the form  $ax^2 \pm bx \pm c$ ;
25. Find LCM and HCF of algebraic expressions by using a factorization method;
26. Find the cube of an algebraic expression of two terms;
27. Simplify algebraic expressions by using four operations and brackets;
28. Simplify rational algebraic expressions up to two terms by using four fundamental operations;
29. Simplify the algebraic expressions involving indices;
30. Solve linear equations of one variable and solve linear inequality of one variable;
31. Solve simultaneous linear equations; and
32. Solve quadratic equations by using factorization method.

The content domains and their weightage drawn from the curriculum are presented in Table 3.1.

**Table 3.1: Content domains for Mathematics in Grade 8**

Content Domain	Sub-domain	Percentage of weightage	
Geometry	Geometry	24	40
	Coordinate Geometry	5	
	Transformation Geometry	6	
	Mensuration	5	
Arithmetic	Numeracy	14	30
	Arithmetic	16	
Data and Sets	Statistics	5	10
	Sets	5	
Algebra	Algebra	20	20

The framework further elaborated the content details in each of the four content domains: Geometry, Arithmetic, Data and Sets, and Algebra.

Based on the contents and general competencies in each content domain, 32 criteria and six standards for each criterion were developed through the involvement of teachers and experts in workshops at different stages. Six standards for each criterion describe different levels of competencies and provide information regarding how well students

demonstrate their competencies. Three standards— Basic, Proficient and Advanced— were categorized first; and then they were further categorized into six levels: 1 and 2 (for basic); 3, 4 and 5 (for proficient); and 6 (for advanced). The following table (Table 3.2) presents the general standards and their descriptors:

**Table 3.2: General Standards and their descriptors for Grade 8 in Mathematics**

Standard	Levels of Standards	General Descriptors	General Descriptors for Mathematics
<b>Basic :</b> Partial mastery of prerequisite knowledge and skills that are essential for proficient work for the Grade	Level 1	Students demonstrate <b>basic pre-requisite</b> knowledge and skills needed for Grade 8 curriculum.	Have the basic pre-requisite knowledge and skills of the content. Perform four basic operations in whole number, fractions and decimals. Read bills, pictographs and bar graphs. Change fractions into decimals and percentage. Draw standard angles up to $90^\circ$ using a straight edge and compass. Recognize, categorize and sketch rectilinear figures. Calculate the area of rectangles and squares, and volume of cube and cuboid. Perform basic operations of binomial algebraic expressions. Locate an ordered pair.
	Level 2	Students demonstrate a <b>limited basic</b> understanding of knowledge and skills specified in the curriculum.	Understand the concept of square and square root, cube and cube root, factorization, equation and indices; can simplify integers, find profit and loss, simple interest, unitary method. Calculate area and volume of cuboids/cubes and spheres. Perform simple estimations; simplify algebraic expansions;

			and factorize simple quadratic expressions. Construct standard angles up to $180^\circ$ ; compute interior and exterior angles of regular polygons; have concept of measure of central tendency (mean); read histogram and bar graph and presentation; use scale drawing to estimate the distance; and transform the figure/object using translation, reflection, rotation and enlargement. Use mathematical notations and express them in own words. Solve simple verbal problems involving fraction, decimal and percentage. Have an understanding of similarity and congruency, properties of rectangles and parallelograms.
<b>Proficient:</b> Students demonstrate competency over subject matter, including subject-matter knowledge, application of such knowledge to real-world	Level 3	Students demonstrate an <b>adequate</b> understanding of knowledge and skills specified in the curriculum and demonstrate a <b>partial proficiency</b> in applying such knowledge and skills.	Solve routine problems, show a little computation ability in a range of mathematical concepts, and read and compare data from the graph. Solve verbal problems with simple operations. Calculate the value of simple interest and amount. Solve one variable linear equation.

situations, and analytical skills appropriate to the subject matter.	Level 4	Students demonstrate an <b>adequate proficiency</b> in understanding of and ability to apply knowledge and skills specified in the curriculum.	Have a computational ability in all content areas. Have a limited ability on abstraction of mathematical concepts. Construct and verify geometrical properties of rectilinear figures (triangles, quadrilaterals). Create simple individual data and present them in charts and figures. Solve problems based on multi-operational calculations. Define mathematical terms. Solve one variables linear equation graphically. Solve algebraic rational fractions up to two terms.
	Level 5	Students demonstrate a <b>thorough proficiency</b> in understanding of and ability to apply knowledge and skills specified in the curriculum, including the combining of more than one relation together for solving problems.	Have a functional ability of mathematical concepts to solve daily life problems meaningfully; solve all ranges of problems in all content areas (multi-operational), construct polygons, solve simple verbal problems on sets (2 sets), solve linear equations in two variables and quadratic equations; calculate the area and volume of combined shapes; show the relation between two variables and represent graphically. Compare the numbers presented in a binary and quinary system. Define mathematical terms precisely. Solve algebraic rational fractions up to three terms.

<b>Advanced :</b> Outstanding performance with an adequate level of abstraction.	Level 6	Students demonstrate an <b>advanced</b> ability to apply knowledge and skills specified in the curriculum in a new and unfamiliar situation, and show an ability to combine and use various relations and components of knowledge and skills in order to solve the problems and develop a new relation.	Have an ability to interpret the data presented in graphs and tables; draw conclusions; solve unseen problems; prove theorems deductively. Describe the process of calculations and create and solve mathematical problems.
---	---------	---	---

Based on these general standards, their levels and descriptors for the six levels of competencies in each criterion have been developed. This standard detail helped to develop the test items to measure various levels of competencies. However, these items were tentative to describe the proficiency levels of students in which the final proficiency levels of students in mathematics were determined with the estimation of students' abilities and transferring in a single scale by using the data from the assessment.

Based on the curricular objectives and contents, the following 32 criteria were defined for assessing students' achievement at Grade 8 in Mathematics:

1. Identification and application of the properties of vertically opposite angles and adjacent angles.
2. Identification and application of the properties on corresponding, alternate and co-interior angles formed by a transversal with parallel lines.
3. Investigation and application of the angle sum property of a triangle, isosceles triangle and equilateral triangle.

4. Construction of regular polygons and rectangle.
5. Verification of the properties of parallelogram, square and rectangle.
6. Familiarity of the conditions of congruency and similarity of triangles, and solution of the problems related to similarity and congruency of triangles.
7. Identification of the relation between the diameter and the circumference of a circle; and deriving and using the formula to solve the related problems.
8. Description of the properties of solids (cube, cuboids, tetrahedron, cone and cylinders, prism and pyramids) and preparation of nets of cube, cuboids, tetrahedron, cone and cylinders.
9. Finding the distance between two points using Pythagoras relation.
10. Calculation of the areas of triangles and quadrilaterals.
11. Solution of problems related to the area and volume of cube and cuboid.
12. Reflection, rotation and translation of geometric objects using co-ordinates.
13. Application of bearing and scale drawing.
14. Simplification of the expressions with brackets.
15. Conversion of binary and quinary numbers into decimal numbers and vice versa.
16. Identification of real number system; differentiation of rational and irrational numbers.
17. Expressing numbers into scientific notation.
18. Solution of problems on Ratio, proportion and percentage.
19. Solution of problems of profit and loss involving discount and VAT.
20. Solution of simple problems using unitary method.
21. Solution of simple problems related to simple interest.
22. Finding median, mode and range of an individual data, and drawing pie chart as well as line graph.
23. Finding the difference and complement of a sets; solution of simple verbal problems using Venn-diagrams.
24. Factorization of algebraic expression in the form of  $a^2 - b^2$ , perfect square trinomial, trinomial of the form  $ax^2 \pm bx \pm c$ .

25. Finding LCM and HCF by factorization method.
26. Finding the cube of a binomial algebraic expression.
27. Simplification of algebraic expressions using four operations and brackets.
28. Simplification of rational algebraic expressions up to two terms using four fundamental operations.
29. Solution of the problems of simplification involving indices.
30. Solution of the linear equation of one variable; representation of one variable linear inequality in a straight line.
31. Solution of simultaneous linear equations.
32. Solution of quadratic equation using factorization method.

The six standards for each of the above criteria have been defined to identify different levels of proficiency of students in each criterion. The items were developed by considering these standards in each criterion. In addition, the item specification was prepared in developing the test items. The items in mathematics were developed by considering the following item specification framework:

**Table 3.3: Table of specification for item selection**

Content domain	Criteria No.	Weightage	Item type	Weightage for items of various standards
Geometry	1-13	40%	Both SR (MC) and CR (very short and short answer) items	The weightage of items in each set should be around as follows: Level 1: 10%, Levels 2, 3, 4 and 5 each; 20%, and Level 6: 10%.
Arithmetic	14-21	30%		
Data and Sets	22, 23	10%		
Algebra	24 -32	20%		
Total		100%		

### Framework for Science

The framework for science begins with describing the overall objectives of teaching Science in school, as described in the curriculum. As stated in the curriculum approved by the government of Nepal, the overall objective of teaching science is to help students

develop the basic knowledge of scientific concepts, principles and laws. The curriculum states that teaching science plays a vital role in the development of students' scientific attitudes, scientific knowledge and creativity. The efforts to teaching science are concentrated on the development of science and technology literacy among students. In addition, teaching science also helps students utilize their leisure time by involving them in innovative activities; provides them with foundation for further study; and draws their interest towards scientific activities. More importantly, science education imparts the students with the skills of observation and inquiry and helps to develop students' competency in developing knowledge and skills for the solution of problems in daily life (see, CDC, 2012).

After defining scientific literacy and stating the overall objectives of science teaching at basic school education, the framework analyses the curriculum of Grade 6 to 8 in Science. The following are the general competencies for basic level Science (Grades 6 - 8) as mentioned in national curriculum (CDC, 2012).

1. Observe and present the facts, process and impacts of surrounding objects and events;
2. Describe scientific concept, fact, principle and laws and use them in daily life;
3. Develop and use the science process skills;
4. Identify the various forms of energy and orient towards their appropriate use and conservation;
5. Identify the properties of matter and use them into practice;
6. Identify the interrelationship between living beings and environment;
7. Explain the importance of environment and orient towards its conservation and development;
8. Present the life process and life cycle of living things;
9. Describe the characteristics and importance of some important plants and animals of Nepal and be aware for their conservation; and
10. Discover and compare the facts related to earth, space and nature.

These competencies are general in nature. So they were elaborated in each Grade for making them more specific. The following are the competencies set by the curriculum for Grade 8 in Science (CDC, 2012):

**Area: Physics**

**1. *Measurement***

- Define fundamental and derived units.
- Identify measurement of mass, weight and time.

**2. *Velocity and acceleration***

- Explain velocity and relative velocity.
- Introduce acceleration and retardation.
- Derive and use equations related to velocity and accelerations.
- Solve the numerical problems related to equations of velocity and acceleration.

**3. *Simple machine***

- Define lever and explain its principle.
- Introduce MA, VR and efficiency of lever.
- Solve the numerical problem related to MA, VR and efficiency.

**4. *Pressure***

- Introduce atmospheric pressure and explain its importance.
- Introduce pressure of liquid.
- Derive the formula of liquid pressure and solve the numerical problems related to it.
- Introduce density and relative density and write their formulae.
- Explain the process of floating and sinking.
- Solve simple numerical problems related to density.

**5. *Work, energy and power***

- Show the relation and difference between work, energy and power.
- Explain and demonstrate transformation of energy.
- Solve simple numerical problems related to work, energy and power.

## **6. Heat**

- Introduce heat and temperature and establish the relation between heat and temperature.
- Determine the units of temperature and show the interrelationship between them and convert their units.
- Explain the structure and working system of a clinical thermometer and simple thermometer.

## **7. Light**

- Identify mirror with types and demonstrate the reflection of light through a spherical mirror.
- Demonstrate the image formed by a spherical mirror keeping the object at different positions and draw a ray diagram of each.

## **8. Sound**

- Introduce terms related to sound (frequency, velocity and wave length).
- Introduce the effect of reverberation and echo with differentiation between them.

## **9. Magnetism**

- Explain the molecular theory of magnetism.
- Define magnetic induction.
- Demonstrate and explain magnetic induction.
- Describe the reasons of demagnetization.
- Describe the ways to conserve magnetic energy.

## **10. Electricity**

- Explain and demonstrate structure and uses of a dry cell and simple cell.
- Introduce domestic electrification and its use.
- Introduce fuse and MCB and state their use.

**Area: Chemistry**

***11. Matter***

- Define the properties of proton, neutron and electron by demonstrating a model of an atom.
- Write molecular formula of common compounds.
- Introduce Mendeleev's periodic table in brief.
- Define valency and find out valency of the first twenty elements on the basis of electronic configuration.
- Define atomic number and atomic weight of an element and find the number of proton, neutron and electron based on it.
- Define molecular weight and solve related numerical problems.
- Define chemical equations and express it in words and formula.

***12. Mixture***

- Introduce and demonstrate fractional distillation, steam distillation and chromatography.

***13. Metal and non-metal***

- Introduce metal and non-metals.
- Express the use of metals and non-metals in daily life.
- Give a general introduction of metals (Iron, Copper, Gold, Silver) used in daily life.

***14. Chemistry, acid, base and salt***

- Introduce acid base and salt, describe their characteristics and mention their use.
- Introduce indicator and use litmus to separate acid, base and salt.
- Prepare a litmus paper from different parts of plant.
- Give an introduction of a pH scale and its use.

***15. Some useful chemicals***

- Define and differentiate hard and soft water after explaining the physical and chemical properties.

- Identify the type of hardness of water.
- Introduce sodium carbonate, sodium bicarbonate and glycerol, and describe their properties and use.

## **Area: Biology**

### ***16. Living beings***

- Introduce microorganisms (bacteria, virus and fungi).
- Describe modification of root, stem and leaf and their uses.
- Draw a diagram of Dicot and Monocot seed.
- Distinguish between monocotyledonous and dicotyledonous seeds.
- Elucidate the different ways of seed dispersal.
- Demonstrate seed germination process and its requirement.
- Show different parts of a flower and their importance in fertilization.
- Describe life cycle of a flowering plant.

### ***17. Cell and tissue***

- Explain the epithelium tissue and meristematic tissue in plants and animals.
- Describe the interrelationship of cells, tissues and organs of human body.

### ***18. Life process***

- Describe sexual and asexual reproduction processes in plants.
- Describe different types of sexual reproduction processes in animals.
- Introduce and describe human circulatory system.
- Define and prove experimentally the photosynthesis process of plants and its requirements.

## **Area: Geology and Astronomy**

### ***19. Structure of the earth***

- Describe internal and external structures of the earth.

**20. *Weather and climate***

- Define climate with a description of factors affecting climate change.
- Introduce the climate of Nepal.
- Explain the process and effect of monsoon in Nepal.

**21. *Earth and space***

- Explain the hypothesis about the origin of earth.
- Explain the position of the sun and the earth in different seasons.
- Explain the phases of moon.

**Area: Environment Education**

**22. *Environment and its balance***

- Describe natural resources and human dependency.
- List national parks, wild life reserves, conservation areas and hunting reserves.
- Explain the status, need and importance of forest.
- List protected plants and animals.
- Describe endangered animals of Nepal and the ways of conserving them.
- Show the inter-relationship between plants, animals and ecosystem.

**23. *Environmental degradation and conservation***

- Explain the causes and effects of environmental pollution.
- Describe the causes and impact of greenhouse effect.
- Identify the ways to minimize the effects of climate change in the environment.
- Explain the causes of acid rain and its effect in the environment.
- Explain the ways of conserving the environment.
- Develop knowledge about natural disasters and its causes.
- Build awareness of natural disasters and the knowledge and skills for managing them.
- Discuss the ways of disaster management and ways to minimize the disaster risk.
- List GOs, NGOs, INGOs and describe their role to conserve the environment.

## 24. *Environment and sustainable development*

- Introduce and state the importance of sustainable development.
- Explain the interrelationship between population, environment and development.
- Explain local practices for sustainable development.

The content domains and their weightage drawn from the curriculum are presented in Table 3.4.

**Table 3.4: Content domains and their weightage for Science Grade 8**

Content Domains	Percentage of weightage
Physics	26
Chemistry	22
Biology	20
Geology and astronomy	12
Environment education	20

The framework just presented has elaborated content details in each of the five content domains: Physics, Chemistry, Biology, Geology and Astronomy, and Environment Education.

Based on the contents and general competencies in each content domain, 24 criteria and six standards for each criterion were developed through workshops organized with the involvement of teachers and experts at different stages. Six standards for each criterion describe different levels of competencies and tell how well students demonstrate their competencies. In this assessment, three standards (Basic, Proficient and Advanced) were categorized first; and then they were further categorized into six levels: 1 and 2 (for Basic); 3, 4 and 5 (for Proficient); and 6 (for Advanced). The following table presents the general standards and their descriptors:

Table 3.5: General Standards and their Descriptors for Grade 8 in Science

Standards	Levels of Standards	General Descriptors	General Descriptors for Science
<b>Basic:</b> Partial mastery of prerequisite knowledge and skills that is essential for proficient work at the grade	Level 1	Students demonstrate <b>basic pre-requisite</b> knowledge and skills needed for Grade 8 curriculum.	<ul style="list-style-type: none"> <li>• Use familiar instruments for measurement of length, mass, weight and time in daily life.</li> <li>• Explain the basic concept of magnetic induction, distance, displacement, density of substances.</li> <li>• Give examples of different classes of lever, works and forms of energy, types of energy.</li> <li>• List out the sources of heat, cell, acid, base and salt, natural resources and environment degradation.</li> <li>• Describe the basic concept of atmosphere, atmospheric pressure and liquid pressure. State the laws of reflection of light.</li> <li>• Introduce sound waves, matters, element, compound, atom, molecule, rocks, minerals, ores, and structure of air, sustainable development and natural disasters.</li> <li>• Draw the diagram of electric circuit.</li> <li>• Write physical properties of some useful chemicals like water, glycerol, sodium carbonate and sodium bicarbonate.</li> <li>• Identify the use of metals in daily life, functions of different parts of plants, and</li> <li>• Name the members of solar system.</li> </ul>
	Level 2	Students demonstrate <b>limited basic</b> understanding of knowledge and skills set forth in the curriculum.	<ul style="list-style-type: none"> <li>• Identify the examples of fundamental and derived units.</li> <li>• Describe the relation of weight of an object and mass.</li> <li>• Explain the concept of speed, velocity, production of longitudinal wave, hardness of water.</li> <li>• Differentiate between heat and temperature, the rotation and revolution of earth.</li> <li>• Solve the practical problems related to MA and VR by using given information.</li> <li>• Compare the density of solid, liquid and gas.</li> <li>• Explain the process of magnetic induction.</li> <li>• Identify the relation between height and atmospheric pressure, depth and pressure of liquid.</li> <li>• Explain work, energy, speed and medium of sound.</li> <li>• Measure the temperature of human body.</li> </ul>

			<ul style="list-style-type: none"> <li>• Recognize the types of acid and base (Strong acid, soft acid, alkali, base, strong base, weak base).</li> <li>• Identify the physical characteristics of different metals, components of soil and cell organelles.</li> <li>• Recognize the examples of different organs that take part in respiration, national parks and wild life reserves of Nepal.</li> <li>• Explain the relationship between speed and medium of sound.</li> <li>• Describe the methods of separation of mixtures, structure of atmosphere, degradation of natural resources and their effect, importance of sustainable development.</li> <li>• Recognize the name and symbol of elements up to atomic no. 20, molecular formula of general molecule.</li> <li>• Draw the ray diagram of reflection of light.</li> </ul>
<b>Proficient:</b> Students demonstrate competency over subject matter, including subject-matter knowledge, application of such knowledge in real-world situations, and analytical skills appropriate to the subject matter.	Level 3	Students demonstrate <b>partial proficiency</b> in understanding and ability to apply knowledge and skills set forth in the curriculum.	<ul style="list-style-type: none"> <li>• Recognize the formula of velocity, speed and acceleration/relative velocity, work and power.</li> <li>• Differentiate between input work and output work.</li> <li>• Compare the density of different substances.</li> <li>• Verify the relation <math>P = \text{hdg}</math>.</li> <li>• Describe the types of work, wave length, velocity and frequency of sound wave.</li> <li>• Identify subatomic particle based on the atomic structure.</li> <li>• Identify the relation of mass and weight.</li> <li>• Explain demagnetization, calibration process in thermometer, image formed by mirror, reflection of sound, household wiring, process of distillation, concept of eco-friendly development and reproduction in animals.</li> <li>• Describe changes in earth surface (erosion and deposition), importance of forest, and classification of animal and plant tissues.</li> <li>• Explain the cause of hardness of water, uses of some important acid, base and salt.</li> <li>• Recognize the molecular formula of general compounds like glycerol, sodium carbonate and sodium bicarbonate.</li> </ul>

			<ul style="list-style-type: none"> <li>• Differentiate between metal and non-metal, weather and climate.</li> <li>• Describe the causes of evolution of life on earth, environmental pollution and their effects in our environment.</li> <li>• Distinguish between matter, element, compound, atom and molecule.</li> </ul>
	Level 4	Students demonstrate <b>adequate proficiency</b> in the understanding of and ability to apply knowledge and skills set forth in the curriculum	<ul style="list-style-type: none"> <li>• Describe time, mass, length, area, volume, velocity/speed etc. as fundamental and derived units.</li> <li>• Explain fractional distillation and chromatography, greenhouse and biodiversity.</li> <li>• Explain relative velocity, conservation of energy and transformation of energy.</li> <li>• Explain the relationship between mass and density, volume and density, and wave length, velocity and frequency of sound.</li> <li>• Compare the subatomic particles with their units and nature, characteristics (position, mass and charge) of atomic particles.</li> <li>• Describe the removal of hardness of water, greenhouse effect, and reproduction in plants. Solve the numerical problems of input and output works of lever.</li> <li>• Recognize the formulae of density and relative density.</li> <li>• Explain the relation of liquid pressure with depth, density and gravitational acceleration.</li> <li>• Describe the relationship among work, energy and power.</li> <li>• Identify the interrelationship between Celsius and Fahrenheit scale.</li> <li>• Differentiate between image formed by convex and concave mirror.</li> <li>• Describe the monsoon, climate and weather of Nepal.</li> <li>• Introduce fuse and MCB with its application.</li> <li>• Identify the uses of some metals, non-metals, metalloids, indicator and universal indicators.</li> <li>• Describe the preparation of litmus paper from petals of flowers.</li> <li>• Classify plant and animal tissues.</li> </ul>

			<ul style="list-style-type: none"> <li>• Compare and contrast minerals and rocks, metallic and non-metallic minerals.</li> <li>• Explain the hypothesis about origin of the earth.</li> </ul>
	Level 5	Students demonstrate <b>thorough proficiency</b> in understanding of and ability to apply knowledge and skills set forth in the curriculum including the combining more than one relation together for solving the problem.	<ul style="list-style-type: none"> <li>• Explain the process to measure area and volume of regular surface and objects.</li> <li>• Apply the concept of fundamental and derived units to measure some common derived quantities like area and volume, and express them in their respective units.</li> <li>• Solve the numerical problem related to velocity, accelerations and relative velocity, efficiency of lever, liquid pressure (when the value of density of liquid and gravitational acceleration are given), work done and power.</li> <li>• Explain the principle of flotation, molecular theory of magnetism.</li> <li>• Identify and explain the use of distillation and chromatography, chemical properties of water with chemical reaction, process of blood circulation in human being, characteristics and uses of minerals found in Nepal with their ore, causes of season change.</li> <li>• Propose the ways of conserving environment, disaster management, minimize the risk and the practices about the sustainable development in the context of the world.</li> <li>• Relate the theory of sinking and floating with examples in his or her surroundings.</li> <li>• Solve the numerical problems of conversion of the different units of temperature from one into another.</li> <li>• Draw a ray diagram related to spherical mirror (Concave &amp; convex).</li> <li>• Derive the relationship among speed wavelength and frequency of sound. Demonstrate the structure and function of simple and dry cell.</li> <li>• Construct an atomic model and hence write electronic configuration based on <math>2n^2</math> formula.</li> <li>• Write the valency of elements up to 20 based on electronic configuration, and physical characteristics of non-metals.</li> </ul>

			<ul style="list-style-type: none"> <li>• Identify acid, base and salt using indicators.</li> <li>• Establish the interrelationship between cell, tissue and organ in human body.</li> <li>• State the monsoon of Nepal, present the effects of monsoon in Nepal.</li> <li>• Measure area and volume of regular surface and objects under given instruction.</li> <li>• Point out the endangered animals.</li> </ul>
<b>Advanced:</b> Outstanding performance with adequate level of abstraction	Level 6	Students demonstrate <b>advanced</b> ability to apply knowledge and skills set forth in the curriculum in a new and unfamiliar situation, and ability to combine and use various relations and components of knowledge and skills in order to solve the problems and develop a new relation.	<ul style="list-style-type: none"> <li>• Understand the relation between fundamental and derived units.</li> <li>• Measure volume of objects having irregular shapes by liquid displacement using measuring cylinder perfectly</li> <li>• Derive the equation related to velocity and acceleration and apply it to solve the related numerical problems.</li> <li>• Apply the concept of density, relative density and law of floatation in his or her daily life.</li> <li>• Solve some complex numerical problems (when value of gravitational acceleration and density of water is not given), related to heat and temperature and atomic weight of given atom.</li> <li>• Describe the system of human body based on organs and their functions, photosynthesis process in plants, process of removal of permanent hardness of water reaction, chemical properties of acid, base and salt.</li> <li>• Find out the acidity and basicity by using pH scale, soil formation process, ways of conservation of soil and the principles of suitable development of NTNC, IUCN, WWF, UNEP and ICIMOD and their role for the environment conservation and need and methods of conservation of endangered animals.</li> <li>• Draw ray diagrams keeping the objects at a different partition of concave and convex mirror.</li> <li>• Analyse effect and use of echo and reverberation of sound and solve the simple numerical problems of sound.</li> <li>• Write the molecular formula of compounds by using criss-cross method.</li> <li>• Demonstrate molecular theory of magnetism with figure; explain the process of distillation and</li> </ul>

			<p>chromography observing provided diagram and the phases of moon.</p> <ul style="list-style-type: none"> <li>• Classify the metals, non-metals and metalloids in a simple periodic table.</li> <li>• Establish the interrelationship among weather, climate and monsoon.</li> </ul>
--	--	--	--

Based on these general standards, their levels and descriptors for six levels of competencies have been developed under each criterion. The detailed standards helped to develop the test items to measure the various levels of competencies. However, these items were tentative to describe the proficiency levels of students in which students' final proficiency levels in science were set with the estimation of students' abilities and item difficulties in a single scale.

Based on curricular objectives and contents, the following 24 criteria are defined for assessing students' achievement at Grade 8 in Science:

1. Identification of differences between fundamental and derived units and measurement of mass, weight and time;
2. Derivation of equations of motion and solution of numerical problems using the equations;
3. Solution of the numerical problems related to efficiency of lever;
4. (a) Explanation of Atmospheric pressure, pressure of liquid, and process of floatation;  
(b) Derivation of the formula of liquid pressure and solution of the numerical problems related to density, relative density and liquid pressure;
5. Identification of the relation of work, energy and power solution of the numerical problems using the relation of work, energy and power;
6. Explanation of relation between heat and temperature, and working system of clinical thermometer and inter-conversion of units of temperature;
7. Explanation of types of mirror and drawing the ray diagrams formed by spherical mirror keeping the object in different positions;
8. Explanation of molecular theory of magnetism, magnetic induction, demagnetization and ways to conserve the magnetic energy;
9. Explanation of molecular theory of magnetism, magnetic induction, demagnetization and ways to conserve magnetic energy;

10. (a) Explanation and demonstration of the structure of different types of cells;  
(b) Introduction and use of domestic electrification, fuse and MCB;
11. (a) Identification of subatomic particles, finding the valency, atomic number, atomic weight of the first twenty elements;  
(b) Introduction of periodic table and writing some chemical equations;
12. Introduction and demonstration of fractional distillation, stem distillation and chromatography;
13. Classification of elements based on metallic property and introduction to the uses of metals (Iron, Copper, Gold, and Silver) ;
14. (a) Introduction to acid, base, and salt in terms of their properties and uses;  
(b) Classification of matters with the help of indicators;  
(c) Introduction of pH scale and its use;
15. Classification of types of water in terms of hardness and introduction to some useful chemicals like sodium carbonate, sodium bicarbonate and glycerol with their properties and uses;
16. Introduction to micro-organisms and description of flower, modified parts of plants, structure of seed, its germination and dispersal, life cycle of flowering plants;
17. Explanation of plant and animal tissues and interrelationship of cell, tissues, and organs of human body;
18. Explanation of reproduction in organisms, blood circulation in human body and photosynthesis process in plants;
19. Description of internal and external structure of the earth;
20. Description of weather and climate change, monsoon formation and its effect in Nepal;
21. Explanation of the origin of earth, season change and phases of moon;
22. Description of natural resources and their importance and conservation;
23. Explanation of environmental degradation, conservation and introduction to organizations involved in environmental conservation;
24. Explanation of sustainable development and interrelationship among population, environment and development;

Six standards to each of the above criteria have been defined to identify different levels of proficiencies of students in each criterion. The items were developed considering these

standards in each criterion.

The item specification grid was also prepared to develop test items. The items in Science were developed by considering the following item specification table:

**Table 3.6: Table of specification for item selection**

Domain	Criteria No.	Weightage	Item type	Weightage of items of various standards
Physics	1-10	26%	Both SR (MC) and CR (very short and short answer)	The weightage of items in each set should be around as follows: Level 1: 10%, Level 2, 3, 4 and 5 each: 20%, and Level 6: 10%.
Chemistry	11-15	22%		
Biology	16-18	20%		
Geology and astronomy	29-21	12%		
Environmental Education	22-24	20%		
Total		100%		

### Framework for Nepali

नेपाली भाषा सरकारी काम काजको भाषा हुनुको साथै विभिन्न भाषाभाषीका नेपालीबीचको सञ्चार र सम्पर्कको माध्यम भाषा (lingua franca) का रूपमा पनि स्थापित छ । विभिन्न प्रकारका ज्ञान विज्ञानका लेख्य सामग्री यही भाषामा उपलब्ध हुने हुँदा ज्ञान तथा सूचना आर्जन गर्न यही भाषाको सामर्थ्य आवश्यक पर्दछ । सूचना तथा प्रविधिको क्षेत्रमा पनि नेपाली भाषाको प्रयोग बढ्दै गएको छ । यसरी विभिन्न क्षेत्रमा नेपाली भाषा प्रयोगको व्यापकताले व्यक्तिको दैनिक सामाजिक, आर्थिक, साँस्कृतिक जीवनका व्यवहारिक कार्य सञ्चालनका लागि नेपाली भाषाको सामर्थ्य अपरिहार्य मानिन्छ । विद्यालयदेखि उच्च तह सम्मको शिक्षामा शिक्षण सिकाइको प्रमुख माध्यम नेपाली भाषा नै भएकोले विद्यालय तहको पाठ्यक्रममा नेपाली भाषा शिक्षणले महत्त्वपूर्ण स्थान पाउँदै आएको छ ।

विद्यालय शिक्षाको प्रारम्भिक तह देखि नै नेपाली भाषा अनिवार्य विषयका रूपमा पठनपाठन हुँदै आएको छ । आधारभूत शिक्षा पाठ्यक्रम २०६९ ले कक्षा ८ मा नेपाली विषयको साप्ताहिक पाठ्यभार ५ र पूर्णाङ्क १०० निर्धारण गरेको छ । यो विषय अध्ययन अध्यापनको उद्देश्य नेपाली भाषामा भाषिक सीप र सिर्जनात्मक क्षमता विकास गराउनु रहेको छ । तसर्थ भाषाका मुख्य सक्षमता–भाषिक सक्षमता र कार्यसम्पादन (Competence and performance) लाई लक्ष्य बनाई भाषिक सीप विकासमा कक्षा ८ को पाठ्यक्रम केन्द्रित रहेको छ ।

नेपाली भाषाका अपेक्षित सक्षमता र कार्यसम्पादनलाई सुनाइ, बोलाइ, पढाइ र लेखाइ गरी ४ भाषिक सीपमा सक्षमताहरु निर्धारण गरिएको छ ।

पाठ्यक्रमद्वारा निर्धारित उल्लिखित भाषिक सीपमा सक्षमता विकास गर्न कथा, कविता, जीवनी, प्रबन्ध, निबन्ध, रुपक/ संवाद, चिठी जस्ता विधाका सामग्रीहरु पाठ्यवस्तुमा समावेश गरिएका छन् । पाठ्यवस्तुका रुपमा रहेका विधा शिक्षण सिकाइबाट पाठ्यक्रमद्वारा निर्धारित सीपमा सक्षमता हासिल भए नभएको सुनिश्चित गर्न सिकाइ परीक्षण तथा मूल्याङ्कन खाका समेत निर्धारित गरिएको छ । यसै खाका अनुसार विभिन्न विषयवस्तुका क्षेत्र सुनाइ, बोलाइ, पढाइ, लेखाइ, व्याकरण र शब्द भण्डारका क्षेत्रहरुमा भाषिक सीपको परीक्षण गर्न निर्देश गरिएको छ भने परीक्षा साधनका रुपमा वस्तुगत, विषयगत तथा प्रयोगात्मक कार्यहरु निर्धारण गरिएको छ ।

कक्षा ८ का विद्यार्थीहरुमा भाषाका सुनाइ, बोलाइ, पढाइ र लेखाइका सीपगत सक्षमताहरु निर्धारण गरिएका छन् । ती सीपगत सक्षमताअन्तर्गत नै शब्दभण्डार तथा कार्यमूलक व्याकरणसम्बन्धी सक्षमताहरुसमेत समावेश गरिएको छ । यस कक्षाका विद्यार्थीहरुमा हासिल हुनुपर्ने भाषिक सीपगत सक्षमताहरु निम्नानुसार निर्धारण गरिएका छन् ।

#### ■ सुनाइ र बोलाइ (*Listening and Speaking*)

- शब्दहरुमा प्रयुक्त उच्चार्य वर्णहरुको भिन्नता पहिल्याउन र तदनुरूप शब्द उच्चारण गर्न,
- शब्दहरुको शुद्ध र स्पष्ट उच्चारण गर्न,
- अरुले वर्णन गरेका कुराकानी आफ्ना शब्दमा व्यक्त गर्न,
- सञ्चार माध्यमका सूचना सुन्न र भन्न,
- विभिन्न किसिमका वर्णन तथा अभिव्यक्ति सुनी तिनका मुख्य कुरा भन्न,
- साहित्यिक विधाका पाठहरु आनन्द लिने गरी सुन्न र प्रतिक्रिया जनाउन,
- कुराकानी, प्रश्नोत्तर, संवाद, वादविवाद, छलफल जस्ता मौखिक अभिव्यक्ति ध्यानपूर्वक सुनी तिनमा भाग लिन,
- आफूले देखेका, सुनेका, पढेका, अनुभव गरेका वस्तु, वातावरण तथा घटनाका विषयमा सिलसिला मिलाई मौखिक वर्णन गर्न,
- मौखिक अभिव्यक्ति सुनेर प्रतिक्रिया दिन तथा हाउभाउ र अभिनयको ख्याल गर्न,
- भन्न चाहेका कुरालाई शिष्ट भाषा प्रयोग गरी हाउभाउपूर्ण र प्रभावकारी ढङ्गले व्यक्त गर्न,
- समुदायका व्यक्तिहरूसँग शिष्टतापूर्वक कुरारानी गर्न,
- वक्ताहरुको अभिव्यक्ति सुनी भाषिक मौलिकता पहिचान गर्न ।

### ■ पढाइ (Reading)

- लिखित सामग्रीलाई गति यति मिलाइ शुद्ध र स्पष्टसँग सस्वर वाचन गर्न,
- पाठमा व्यक्त भावअनुसार गति, यति, लय मिलाई पढ्न,
- पाठहरु पढी तिनका मुख्य मुख्य कुराहरु बताउन,
- विभिन्न उद्देश्यले लिखित सामग्रीहरुको मौनवाचन गर्न,
- विभिन्न प्रयोजनका लागि प्रबन्ध/निबन्ध, जीवनी र कथा पढ्न,
- साहित्यिक विधाका पाठहरु आनन्द लिने गरी पढ्न र प्रतिक्रिया जनाउन,
- विभिन्न स्रोतका सामग्री तथा विधाका पाठ पढी शब्द भण्डार वृद्धि गर्न,
- पढेका पाठका शब्दहरुको उपयुक्त प्रयोग गर्न,
- उखान टुक्काको अर्थ बुझी उपयुक्त ढङ्गले प्रयोग गर्न ।

### ■ लेखाइ (Writing)

- हिज्जे र वाक्य गठन मिलाई सफा र शुद्धसँग लेख्न,
- विभिन्न चिन्हको उपयुक्त ढङ्गबाट प्रयोग गर्न,
- शब्द, वाक्य र पाठका अंश सुनेर लेख्न,
- आफूले देखेका, सुनेका, पढेका, अनुभव गरेका वस्तु, वातावरण तथा घटनाका विषयमा लिखित वर्णन गर्न,
- सुनेका र पढेका विषयवस्तुको सारांश लेख्न,
- विभिन्न विषयहरुमा अनुच्छेद, चिठी, निवेदन, निमन्त्रणा पत्र, समवेदना, कथा, जीवनी र वादविवाद सिलसिला मिलाई लेख्न,
- स्तर अनुसारका विषयमा सिलसिला मिलाएर प्रबन्ध लेख्न,
- आफूना रुचि अनुसारका विषयमा मौलिक रचना गर्न,
- शब्दहरुलाई लिखित रूपमा उपयुक्त ढङ्गले प्रयोग गर्न,
- पाठका विशिष्ट अंशहरुको भाव विस्तार/व्याख्या गर्न,
- व्याकरणसम्मत वाक्य रचना गर्न,
- पाठमा प्रयुक्त उखान टुक्काहरुको अर्थ बुझी वाक्यमा प्रयोग गर्न,
- परियोजना कार्यका माध्यमले भाषिक समस्या समाधान गर्न ।

पाठ्यक्रमद्वारा निर्धारित उल्लिखित भाषिक सक्षमताहरूमध्ये यो परीक्षणमा पढाइ र लेखाइसम्बन्धी सक्षमता मात्र परीक्षण गरिने छ। यस परीक्षणका लागि पढाइ र लेखाइसम्बन्धी निम्नानुसारका सीपगत क्षेत्रहरू निर्धारण गरिएको छ।

**Table 3.7: Content domain and weightage of Nepali subject at Grade 8**

सीप (Skill)	क्षेत्र (Domain)	विधा (Area)	समेटिने विषय (Contents covered)
पढाइ र लेखाइ (Reading and writing)	शब्दभण्डार	शब्दार्थ शब्द पहिचान शब्दको वाक्यमा प्रयोग	पर्यायवाची, विपरीतार्थी, अनेकार्थी, उखान टुक्काको अर्थ र प्रयोग
	वर्णविन्यास	शुद्धीकरण	ह्रस्व, दीर्घ, श, स, ष, व र ब उ, ऊकार इत्यादि
	व्याकरण	पहिचान र प्रयोग	पदवर्ग, वाक्य र वाच्य, काल, पक्ष, उपसर्ग परसर्ग आदि
	बोध	विभिन्न विधाका गद्य सामग्री	पाठ्यक्रमद्वारा निर्दिष्ट सबै विधा
	बुँदा टिपोट र सारांश लेखन	गद्य विधा	
	निर्देशित रचना	कथा, जीवनी, प्रबन्ध, वादविवाद/संवाद, चिठी	
	भाव विस्तार/व्याख्या	कथा, कविता, प्रबन्ध, निबन्ध, जीवनी	
	पाठगत प्रश्नोत्तर	कथा, कविता, प्रबन्ध, निबन्ध, जीवनी, तार्किक सीप/समस्या समाधान	
	विवेचना	कथा, कविता, प्रबन्ध, निबन्ध, जीवनी	
	स्वतन्त्र रचना	प्रबन्ध, निबन्ध	

Table 3.8: General standards and their descriptors for Grade 8 in Nepali

भाषिक सक्षमता स्तर (Standards of language competency)	सक्षमता तह (Level of competency)	भाषिक स्तर (Language competency)	स्तरको सामान्य व्याख्या (General description)
आधारभूत सक्षमता  (Basic competency): सीमित भाषिक सक्षमता	१	सीमित बोध तथा अभिव्यक्ति सक्षमता	<ul style="list-style-type: none"> <li>परिचित व्यक्तिगत सन्दर्भका शब्द/पदावली/वाक्य प्रयुक्त मौखिक तथा लिखित भाषिक सङ्कथन (Text) बाट सीमित सूचना/तथ्य बोध तथा अभिव्यक्ति ।</li> <li>व्यक्तिगत दैनिक/जीवन/परिवेश/अनुभवका विषयमा दैनिक बोलिचालीका प्रचलित शब्द/पदावली/वाक्यका साथ सीमित अभिव्यक्ति ।</li> </ul> <p>(सीमित गति र प्रवाहका भाषिक अभिव्यक्तिबाट सीमित सूचना/अर्थ ग्रहण गर्ने; प्रचलित र सामान्य बोलिचालीका शब्द/वाक्यका साथ दैनिक जीवन/परिवेश/अनुभवका विषयमा सीमित सञ्चार; अभिव्यक्तिमा स्थानीयता झल्कने; सामान्य उच्चारणका साथ सीमित पठन प्रवाह; भाषिक अभिव्यक्तिमा वर्ण विन्यास, उच्चारण तथा वाक्य गठन सम्बन्धी त्रुटी रहने)</p>
	२	सामान्य बोध तथा सीमित अभिव्यक्ति सक्षमता	<ul style="list-style-type: none"> <li>परिचित व्यक्तिगत र सामाजिक सन्दर्भका देखेका/सुनेका/विषयवस्तुका विषयमा र प्रचलित शब्द/पदावली/वाक्य प्रयुक्त भाषिक सङ्कथन पढी स्पष्ट उल्लिखित सूचना/तथ्य/अर्थ ग्रहण गर्ने र सीमित शब्द पदावली, वाक्यका साथ अभिव्यक्ति दिने ।</li> <li>परिचित सन्दर्भ, परिवेश विषयवस्तुका विषयमा संक्षिप्त मौखिक तथा लिखित अभिव्यक्ति दिने ।</li> </ul> <p>(उच्चारणमा शुद्धता, पठन तथा अभिव्यक्तिमा सीमित र अपर्याप्त गति, यति, लय, आरोह अवरोह र हाउभाउ; सीमित गति र प्रवाहका भाषिक अभिव्यक्तिबाट आधारभूत सूचना/अर्थ ग्रहण; अभिव्यक्तिमा सामान्य</p>

भाषिक सक्षमता स्तर (Standards of language competency)	सक्षमता तह (Level of competency)	भाषिक स्तर (Language competency)	स्तरको सामान्य व्याख्या (General description)
			स्थानीयता भल्कने सामान्य वाक्य गठन; वाक्य गठन तथा वर्ण विन्यासमा आंशिक त्रुटिको विद्यमानता)
प्रवीणता (Proficiency): कार्यमूलक भाषिक सक्षमता	३	साधारण बोध तथा अभिव्यक्ति सक्षमता	<ul style="list-style-type: none"> <li>परिचित शब्द/पदावली वाक्य प्रयुक्त सीमित दैनिक सामाजिक परिवेशका सरल र संक्षिप्त मौखिक तथा भाषिक सङ्कथनबाट मुख्य बुँदा/सूचना /आशय ग्रहण गर्न; सीमित सन्दर्भको वर्णन गर्न; परिचित विषय/वस्तु/परिवेश/घटनाको सामान्य शब्द/पदावली/सरल वाक्यमा वर्णन गर्न ।</li> <li>(गति/यति/लय/आरोह अवरोह/हाउभाउमा अर्याप्तता; उच्चारणमा शुद्धता भए पनि कम स्तरीयता; अभिव्यक्तिमा यदाकदा स्थानीयता भल्कने; वाक्य गठन तथा वर्ण विन्यासमा आंशिक त्रुटिको विद्यमानता)</li> </ul>
	४	कार्यमूलक बोध तथा अभिव्यक्ति सक्षमता	<ul style="list-style-type: none"> <li>परिचित शब्द/पदावली/वाक्य प्रयुक्त सीमित दैनिक परिवेशमा सरल र संक्षिप्त मौखिक तथा लिखित भाषिक सङ्कथनबाट मुख्य बुँदा शब्द वाक्य, सामान्य आशय बोध गर्न, सङ्कथनका केही सन्दर्भको वर्णन गर्न र आशय बताउन, परिचित विषय वस्तु/परिवेश/घटनाको संक्षिप्त रूपमा मौखिक तथा लिखित अभिव्यक्ति दिन ।</li> <li>(उच्चारणमा शुद्धता भए तापनि गति, यति लय आरोह अवरोहमा अपूर्णता, सामान्य पठन प्रवाह, सरल वाक्य गठनका अभिव्यक्तिमा व्याकरणिक त्रुटिको न्यूनता, परिचित सन्दर्भका शब्द प्रयोगमा वर्ण विन्यास त्रुटि नभएपनि नवीन शब्द प्रयोगमा आंशिक त्रुटिको विद्यमानता)</li> </ul>

भाषिक सक्षमता स्तर (Standards of language competency)	सक्षमता तह (Level of competency)	भाषिक स्तर (Language competency)	स्तरको सामान्य व्याख्या (General description)
स्वतन्त्र वा उच्च सक्षमता (Fluent/ independent or Advance competency): स्तरीय भाषिक बोध तथा अभिव्यक्ति सक्षमता	५	विस्तृत बोध तथा सीमित अभिव्यक्ति सक्षमता	<ul style="list-style-type: none"> <li>● परिचित शब्द/पदावली/वाक्य प्रयुक्त विविध परिवेशका संगठित मौखिक लिखित भाषिक सङ्कथनबाट मुख्य शब्द/वाक्य सहित विस्तृत आशय र सन्दर्भ बोध गर्न; मुख्य शब्दको वर्णन र सान्दर्भिक अर्थ व्यक्त गर्न ; सीमित सूचना सन्दर्भ संश्लेषण गर्न ; टेबुल/ग्राफ/चार्ट प्रस्तुत गर्न ; परिचित विषयमा वस्तु/घटना/परिवेशको सामान्यस्तरमा संगठित मौखिक लिखित अभिव्यक्ति दिन; टेबुल/ग्राफ/चार्टमा प्रस्तुत परिचित सूचना/विवरण/तथ्यको सामान्य वर्णन गर्न ।</li> <li>● उच्चारणमा शुद्धता र स्पष्टता, गति/यति/लय/आरोह/अवरोहमा अपर्याप्तता, सामान्य पठन प्रवाह, वाक्य गठन तथा अभिव्यक्तिमा सीमित व्याकरणीय त्रुटि, वर्ण विन्यासमा सचेत</li> </ul>
	६	स्तरीय बोध तथा स्वतन्त्र अभिव्यक्ति सक्षमता	<ul style="list-style-type: none"> <li>● स्तरीय शब्द/ पदावली/ वाक्य प्रयुक्त विविध परिवेशका संगठित मौखिक/लिखित भाषिक सङ्कथनबाट विस्तृत सन्दर्भ तथा आशय बोध गर्न; बुँदा टिपोट तथा सारांश तयार गर्न; पठित/सुनेको सङ्कथनका मुख्य आशयको सान्दर्भिक व्याख्या विश्लेषण तथा पुनर्वर्णन/पुनर्लेखन गर्न; परिवेश अनुसारका शब्द/पदावली/ वाक्य गठन सहित संगठित सङ्कथन तयार गर्न; तालिका/ग्राफ/चार्टमा प्रस्तुत विवरण तथा तथ्यहरूको आधार भूत वर्णन तथा व्याख्या गर्न र परिचित तथ्य/सूचना/विवरणलाई तालिका ग्राफ चार्टमा वर्णन र प्रस्तुत गर्न ।</li> <li>● उच्चारणमा शुद्धता र स्पष्टता; उपयुक्त गति/यति/लय र आरोह अवरोह सहित स्तरीय पठन प्रवाह; वाक्य गठन तथा अभिव्यक्तिमा मौलिक शिल्प र शैली भल्कने/व्याकरणिक नियम तथा वर्णविन्यासको सचेत प्रयोग ।</li> </ul>

कक्षा ८ को नेपाली विषयको पाठ्यक्रमका निर्धारित उद्देश्य र विषयवस्तुसमेतलाई आधारमा कक्षा ८ को नेपाली विषयमा पढाइ र लेखाइ अन्तर्गत विद्यार्थीको उपलब्धि परीक्षणका लागि निम्नअनुसार २६ ओटा मापदण्डहरू परिभाषित गरिएको छ :

### **पढाइ**

१. आफू, आफ्नो घर, परिवार, र विद्यालयसँग सम्बन्धित लिखित वर्णनहरू पढी सम्बन्धित प्रश्नहरूको उत्तर दिन ।
२. समाज, विद्यालय तथा आफ्नो परिवेशसँग सम्बन्धित लिखित वर्णनहरूसम्बन्धी प्रश्नहरूको उत्तर दिन ।
३. चिठी, निमन्त्रणा कार्ड, समवेदना, शुभ कामना कार्डलगायत पढी व्यक्त भाव व्यक्त गर्न ।
४. विभिन्न उद्देश्यले परिचित सन्दर्भका लिखित सामग्रीहरूको मौन वाचन गरी बोध गर्न ।
५. कुनै खास विषयसँग सम्बन्धित वर्णनात्मक अभिव्यक्तिहरू पढी तिनका मुख्य कुराहरू लेख्न ।
६. चित्र, ग्राफ, तालिका लगायतको सान्दर्भिक वर्णन गर्न ।
७. सञ्चार माध्यमबाट प्रकाशित सामग्री र यसका अंशको आशय प्रकट गर्न र बोध गर्न ।
८. प्रश्नोत्तर, भावार्थ, सारांश, व्याख्यालगायत विभिन्न प्रयोजनका लागि प्रबन्ध/निबन्ध, जीवनी र कथा पढ्न र बोध गर्न ।
९. पढेका पाठका शब्दहरूको अभिधागत र सन्दर्भगत प्रयोग गर्न, उखान टुक्काहरूको प्रयोग गर्न र सन्दर्भअनुसार व्याख्या गर्न ।
१०. पठित सामग्रीबाट व्याकरणिक कोटीको पहिचान र प्रयोग गर्न ।
११. लिखित सामग्रीको पूर्वानुमान, परिकल्पना, सन्दर्भ र सूचनाको उपयोग गर्न (कविता तथा अन्य विधाका) ।
१२. विभिन्न विधामा प्रयोग भएका पात्रको समीक्षा गर्न ।
१३. निर्दिष्ट अनुच्छेदलाई निर्देशनअनुसार परिवर्तन गर्न, अनुच्छेदका आधारमा नयाँ अनुच्छेद सिर्जना गर्न तथा अनुच्छेदका आधारमा समस्या समाधान र कारण खोजी गर्न ।

### **लेखाइ**

१४. नेपाली लेख्य ढाँचा अनुसारका वर्ण, शब्द, र वाक्य रचना गर्न ।
१५. नेपाली लेख्य ढाँचा (लिङ्ग, वचन) अनुसार अनुच्छेद मिलाएर लेख्ना
१६. विभिन्न चिह्न, हिज्जे र वाक्य गठन (लिङ्ग, वचन, पुरुष र आदर) मिलाई सफा र शुद्धसँग लेख्न ।
१७. वातावरण तथा घटनाका विषयमा सिलसिला मिलाई निर्देशन पालना गरेर लिखित वर्णन गर्न ।

१८. आफूले देखे सुनेका, पढेका, अनुभव गरेका विषयमा सिलसिला मिलाई स्वतन्त्र वर्णन गर्न ।
१९. सुनेका र पढेका विषय वस्तुको सारांश लेख्न ।
२०. पाठका विशिष्ट अंशहरूको भाव विस्तार/व्याख्या गर्न (कविता लगायतका विधा) ।
२१. शब्दभण्डार (पर्यायवाची, विपरीतार्थी, अनेकार्थी, समावेशक, प्राविधिक, पारिभाषिक र अनुकरणात्मक) र उखान टुक्काको उपयुक्त प्रयोग गर्न ।
२२. चिठी, निवेदन, निमन्त्रणा, शुभकामना, समवेदना जस्ता व्यवहारिक लेखन तयार गर्न ।
२३. आफ्नो रुचिअनुसारका विषयमा मौलिक रचना गर्न ।
२४. परिचित सन्दर्भ र निर्देशनमा आधारित भई मौलिक लेखन गर्न ।
२५. विभिन्न सन्दर्भमा उपयुक्त शैली र संरचनाको प्रयोग गरी स्तरीय भाषामा स्वतन्त्र लेखन गर्न ।
२६. सन्दर्भ अनुसार र समसामयिक विषयमा तर्कपूर्ण प्रस्तुति गर्न र समस्या समाधानका उपाय सुझाउन ।

उल्लिखित भाषिक सक्षमता स्तरका आधारमा पाठ्यक्रमद्वारा निर्दिष्ट विषय तथा पाठ्यवस्तु क्षेत्र र भाषिक सीपगत सिकाइस्तरको विस्तृत खाका तयार गरी प्रश्नपत्रहरू तयार गरिएको थियो । यस उपलब्धि परीक्षणमा पढाइ र लेखाइका सीपहरू मात्र परीक्षण गरिने भएकाले यसमा सुनाइ र बोलाइका सीपसम्बन्धी क्षेत्र तथा स्तरहरू समावेश गरिएको छैन । यो विद्यार्थी सिकाइ उपलब्धि परीक्षण प्रयोजनका लागि पढाइ र लेखाइका क्षेत्रहरूबाट परीक्षा साधन निर्माण गरी सिकाइ उपलब्धि परीक्षण गर्ने गरी स्तर निर्धारण तथा व्याख्या गरिएको छ ।

शब्द भण्डार, व्याकरण तथा वर्ण विन्यासलाई अलग्गै विषयवस्तुका रूपमा समावेश नगरी पढाइ र लेखाइका क्षेत्रमै समावेश गरिएको छ । यसो गर्नाले शब्द भण्डार, व्याकरण तथा वर्ण विन्यासलाई विद्यार्थीले कार्यमूलक रूपमा उपयोग गर्न सके नसकेको परीक्षण गर्न सकिन्छ ।

तल दिइएको विशिष्टिकरण तालिकामा विषयवस्तुको क्षेत्र, मापदण्ड, भार प्रतिशत, प्रश्नका सङ्ख्या र प्रकार, अङ्कको विभाजन र विभिन्न ६ स्तरमा प्रश्नको विभाजन प्रस्तुत गरिएको छ ।

Table 3.9: Table of specification for item selection

विषयवस्तुको क्षेत्र (Content domain)	मापदण्ड सङ्ख्या (Criteria No.)	भार (Weightage)	प्रश्नका किसिम (Types of items)	जम्मा पूर्णाङ्क (Marks)	विभिन्न स्तरमा अङ्क विभाजन (Weightage for items of various standards)
पढाइ (शब्द भण्डार)		40%	SR and CR	28	प्रत्येक स्तरको भार देहायको प्रतिशतको नजिक हुनेछ ।
लेखाइ (शब्द भण्डार तथा कार्यमूलक व्याकरण र वर्ण विन्यास समेत)		60%	SR and CR	42	Level 1: 10%, Levels 2, 3, 4 and 5 each; 20%, and Level 6: 10%.
Total		100%		70	

यहाँ विचार पुऱ्याउनु पर्ने कुरा के छ भने तालिकामा दिइएको विभिन्न स्तरको भार प्रारम्भिक मात्र हो । वास्तविक भारको गणना विद्यार्थीको उत्तर समेतलाई आधार मानी स्तर निर्धारणसम्बन्धी विधिहरुमध्ये कुनै एक विधि प्रयोग गरी प्रत्येक स्तरको न्यूनतम अङ्क (Cut score) निर्धारणबाट गर्नु पर्नेछ । माथि सुझाव गरिएको वर्गीकरण र स्तरले प्रत्येक स्तरका लागि प्रश्नहरु छनोट गर्न सहयोग गर्दछ ।

### 3.3 Cognitive Domain

In addition to content domains, the assessment items of each subject also represented various levels of cognitive domain, which are generally hierarchical in terms of complexity and abstraction of knowledge and skills and their applications. The levels of cognitive domain were adopted from the revised Bloom's Taxonomy for learning (see, Aderson & Karthwohl, 2001). Among the six levels of this taxonomy, the first three (*remembering*, *understanding* and *applying*) are considered separately and the remaining three (*analysing*, *evaluating* and *creating*) are put under a broad *reasoning* skill for the purpose of data analysis.

As Bloom defines, *remembering* shows the ability to memorize previously learned knowledge by recalling facts, terms, basic concepts and answers. *Understanding*

demonstrates the task of understanding the facts and ideas by organizing, comparing, translating, interpreting, giving descriptions, and stating main ideas. *Applying* includes solving problems in new situations by applying the acquired knowledge, facts, techniques and rules in a different way (see, Aderson & Karthwohl, 2001). *Reasoning* is not limited to the solution of routine problems but also includes unfamiliar situations, complex contexts, and solving multi-step problems by using more than one relations and contexts (IEA, 2015).

**Table 3.10: Representation of various cognitive domains in each of the subjects (Mathematics, Science and Nepali)**

Cognitive Domain	Weightage
Remembering	15%
Understanding	35%
Applying	30%
Reasoning	20%
	100%

### 3.4 Item Development and Selection

#### Item development workshop

First, a 10-day workshop was organized to develop test items for each of the subjects (Mathematics, Science and Nepali). School teachers teaching the respective subjects, experts and university teachers were the participants of the item development workshop. Before starting to write test items, the experts provided teachers with some knowledge and skills in developing test items. During the orientation training, in addition to the overview of the framework including domains, criteria, standards, cognitive domains and item specification, some practice sessions were conducted in writing items by focusing particularly on preparing items to measure specific competencies. The workshop drafted about 300 test items of different types (SR and CR items) in each subject.

#### Item revision

The draft test items were edited and translated into English for Mathematics and Science. The draft individual items were trialled among some students in Kathmandu. Moreover, the draft items and students' answer sheets of the trialled items were provided to a group

of subject experts and teachers for review. The experts' workshop reviewed and edited the items and prepared six sets of items for pilot testing. The experts assessed each item against the competencies to be measured, level of standards, representation of various contents and cognitive domains, available time, clarity and level of language, appropriateness of distractors in MC items, and so on.

### **Editing, layout and item booklet preparation for piloting**

The subject experts and language editors worked together in editing the test items. The edited items were grouped into six sets that require 2 hours for students to take the test. While preparing the six test booklets, the sets were developed in similar formats, with the estimated level of standards and difficulties close to each other. The layouts of the booklets were developed with necessary instructions for the students – giving sufficient space for writing CR items, and appropriate size of the font.

### **Review and finalization of items and test booklets for piloting by the subject committee**

In ERO, there are subject committees for each subject included in NASA studies. The subject committees comprised of experienced subject teachers, subject experts, and the university faculty. The items and the six sets of booklets prepared by the expert workshops and edited by the subject and language experts were presented in the subject committee meeting. The subject committee reviewed and revised the items as well as the test booklets of each subject, and prepared the final test items and booklets for piloting. The items and booklets finalized by subject committee were again sent to the language editor for final correction.

At this point, the scoring keys and plans were prepared for each set of questions. During the preparation of scoring key and plan, some revisions were made in test items, which were again discussed in the subject committee meetings and finalized for piloting.

### **Piloting the items**

The six test booklets were printed and packed alternatively for each school. In the piloting of the test, one student took test in only one subject. The packing of the item booklets were

arranged alternatively so that the students sitting adjacent could not copy each other's response. Each set of items was piloted at least among 300 students from 60 schools. The following table shows the number of piloted schools and students in each subject:

**Table 3.11: Pilot testing: number of schools and students**

S. No.	Subject	No. of sets piloted	No. schools piloted	No. of students participated
1	Mathematics	6	60	1800
2	Science	6	60	1800
3	Nepali	6	60	1800
Total		18	180	5400

The schools for the test piloting were selected from different locations including geography and province. The piloting of test was carried out in the last month of the previous session (2016). Those schools selected for the final assessment were not selected for the purpose of piloting. Likewise, the students' answer sheets were collected at ERO immediately after pilot test was over in schools. After collecting the answer sheets, subject teachers scored, following conference marking system. The scorers followed the prepared scoring keys and rubrics.

### **Item analysis and selection of items**

Students' answer sheets were scored by using scoring keys and scoring guidelines. The scores for each item were tabulated in an Excel sheet. During item analysis, item difficulty, item discrimination and appropriateness of distractors were also assessed. The test items were considered as problematic when one or more of the following conditions were present:

- Point-biserial correlation remaining less than 0.20,
- p-value less than 0.20,
- p-value equal to or greater than 0.90,
- Less than 5 percent of students selecting one of the distractors of MC item,

The test items having a range of difficulties were included in the test; however, the test items having a less than 0.20 difficulty index (very difficult) and the test items having more

than 0.90 difficulty index (every easy) were generally excluded. Within the acceptable range of item difficulty, item discrimination was also calculated and the items having 0.20 and more discrimination indexes (Point-Biserial correlation) were included for final test. For multiple choice items, the appropriateness of distractors was assessed by calculating the frequencies of responses. In some cases, the subject experts, instead of rejecting the very easy or very difficult items as well as relatively low discriminating (discrimination index greater than 0 to less than 0.20) items, preferred revising them slightly. Similar conditions were found in the case of effectiveness of distractors. The following table shows an example of the item analysis of piloted items.

**Table 3.12(a): Example of item analysis and decision in Mathematics**

Item	Difficulty/facility	Discrimination/item rest correlation	Decision
1M1	0.80	0.322	1
2M1	0.46	0.198	2
3M1	0.77	0.177	2
4M1	0.33	0.385	1
5M1	0.50	0.291	1
6M1	0.82	0.236	1
7M1	0.82	0.329	1
8M1	0.82	0.283	1
9M1	0.60	0.482	1
10M1	0.30	-0.031	3
11M1	0.74	0.348	1
12M1	0.47	0.315	1
13M1	0.39	0.357	1
14M1	0.68	-0.154	3
15M1	0.78	0.477	1
16M1	0.70	0.524	1
17M1	0.58	0.542	1
18M1	0.58	0.503	1
19M1	0.62	0.63	1
20M1	0.50	0.552	1

*Remark: 1: selected; 2: to be discussed with subject experts; 3: discarded.*

In the above example, the item numbers 10 and 14 were discarded due to their negative item rest correlation. Items 2 and 3 have item rest correlation less than 0.20 but their value is positive. The subject experts discussed and decided whether these items could be excluded or included in the final test. In this situation, the subject experts, in some cases, also suggested some refinement in the item statements or distractors for MC items to make them clearer.

**Table 3.12(b): Example of item analysis and decision in Nepali**

Item	Facility/item difficulty	Item-rest correlation	Remarks
1N1	0.94	0.07	2
2N1	0.64	0.37	1
3N1	0.45	0.61	1
4N1	0.73	0.48	1
5N1	0.66	0.14	2
6N1	0.70	0.53	1
7N1	0.25	-0.06	3
8N1	0.71	0.32	1
9N1	0.91	0.41	1
10N1	0.44	0.41	1
11N1	0.81	0.42	1
12N1	0.56	0.44	1
13N1	0.76	0.36	1
14N1	0.36	0.33	1
15N1	0.52	0.43	1
16N1	0.15	0.34	1
17N1	0.41	0.52	1
18N1	0.24	0.46	1
19N1	0.66	0.48	1
20N1	0.32	0.42	1

*Remark: 1: selected; 2: to be discussed with subject experts; 3: discarded*

**Table 3.12(c): Example of item analysis and decision in Science**

Item	Difficulty/facility	Discrimination/item rest correlation	Remarks
1S1	0.39	0.25	1
2S1	0.39	0.409	1
3S1	0.37	0.368	1
4S1	0.37	0.60	1
5S1	0.36	0.55	1
6S1	0.36	0.50	1
7S1	0.35	0.645	1
8S1	0.34	0.57	1
9S1	0.34	0.61	1
10S1	0.33	-0.04	3
11S1	0.32	0.109	2
12S1	0.32	0.362	1
13S1	0.31	0.15	2
14S1	0.31	0.20	1
15S1	0.31	0.68	1
16S1	0.31	0.37	1
17S1	0.29	0.34	1

*Remark: 1: selected; 2: to be discussed with subject experts; 3: discarded*

In addition to the item analysis statistics, the subject experts reviewed each item and took three types of decisions as mentioned in the table above: select the item as it was; revise the items, and reject the item.

### **Items by content domain and type of items**

Items were of both SR and CR type. The following table shows the total number of items selected in each subject in different content domains:

**Table 3.13: Number of items selected by content domain**

Subject	Content domain	Selective response	Constructive response	Total
Mathematics	Geometry	38	21	59
	Arithmetic	21	16	37
	Data and Sets	3	8	11
	Algebra	8	16	24
	Total	70	61	131
Nepali	पढाइ (शब्द भण्डार)	21	46	67
	लेखाइ (शब्द भण्डार तथा कार्यमूलक व्याकरण र वर्ण विन्यास समेत)	11	13	24
Total		32	59	91
Science	Physics	19	15	34
	Chemistry	13	16	29
	Biology	9	11	20
	Geology and astronomy	10	7	17
	Environment Education	9	10	19
	Total	60	59	119

**Items by content and cognitive domain**

Selected items can be categorised in different cognitive domain. The classification used in the assessment was adopted from Bloom's revised Taxonomy of objectives. The categories are remembering, understanding, applying and reasoning.

**Table 3.14 (a): Selected items by content domain and cognitive domain**

Subject	Domain	Selective response (SR)	Constructed response (CR)	Total
Mathematics	Remembering	26	5	31
	Understanding	32	20	52
	Applying	5	25	30
	Reasoning	7	11	18
	Total	70	61	131

Subject	Domain	Selective response (SR)	Constructed response (CR)	Total
Nepali	Remembering	13	11	24
	Understanding	7	21	28
	Applying	9	7	16
	Reasoning	3	20	23
	Total	32	59	91
Science	Remembering	24	9	33
	Understanding	28	15	43
	Applying	8	19	27
	Reasoning	0	16	16
	Total	60	59	119

While designing item booklets, items from different sources were used. Newly developed and piloted items were bigger in number, but it also selected items from previous NASA and used them as anchor or linking items in each subject. Similarly, some items were used from the released items of TIMSS Grade 8 Mathematics and Science as the linking items. The following table shows the various sources and number of items in each subject.

**Table 3.14 (b): Different sources of items in each subject**

Subject	New items	Items from previous NASA	Items used in TIMSS	Total number of items
Mathematics	106	9	16	131
Science	98	11	10	119
Nepali	83	8	-	91

Among selected items for final test, NASA 2017 used 9 items in Mathematics, 8 in Nepali and 11 in Science from the from NASA 2013 of Grade 8 test as the linking items (to establish link with the NASA 2013). Similarly, in Mathematics and Science, NASA 2017 used 16 and 9 items respectively from TIMSS Grade 8 questions as the linking items (to establish link between TIMSS and NASA 2017).

### **3.5 Item Booklet, Scoring Key and OMR Design**

Selected items, in each subject, were arranged into three booklets with some linking items between the booklets. Scoring keys for SR items and scoring schemes for CR items were prepared for each booklet. Based on the booklets and scoring schemes, OMR sheets were designed to use for data generation and entry process.

#### **Item booklet preparation for final test**

A week-long workshop of the subject experts and teachers was organised for each subject to select the items and prepare the test booklets for the final test of NASA 2017 at Grade 8. ERO provided the team with the final version of multiple sets of test that included the feedback from the test piloting, item analysis statistics, items from previous NASA studies and TIMSS test items for Mathematics and Science with their parameters.

The following process and steps were followed to select the test items and to prepare the three test booklets for each subject:

- The workshop first selected some items from TIMSS released items of Mathematics and Science of Grade 8. The selected items were translated into Nepali and administered among some Grade 8 students, based on which some of the items and data were contextualized as required.
- Some of the items from the previous NASA studies of Grade 8 were also chosen to use them in NASA 2017 of Grade 8.
- Based on the experiences of the previous years' NASA studies as well as pilot test and the specification in the framework, the workshop first estimated the number and types of test items for each test set as planned in the three test booklets of each subject.
- The piloted questions of Mathematics and Science subjects were organized separately with the content domains and test items from the previous NASA studies; and the selected test items from TIMSS were also sorted out separately with the content domains. Similarly, the piloted test items of Nepali were also revised according to their reading and writing domains; and the test items from the previous NASA studies were also reorganized in relation to their reading and writing domains.

- Similar types of items (MC, CR with very short and CR with short answer) having the similar sub-domain with similar content areas in each domain were marked 1, 2 and 3, if the test items are available; and they were sorted with the same marked in a group. The test items from the previous NASA studies and TIMSS were also reorganized within the same group with some distinct identification.
- The set of test items marked with 1 was reviewed based on the specification as well as estimated number of questions and types of questions. If the test items were more than enough for a booklet, some of them were removed from the set whereas if test items were not sufficient for a booklet in number the remaining test items from the accumulated test sets were selected.
- When set 1 was completed, some test items from the first set were identified to use them to set 2; and these items were placed to the other sets with a unique ID as planned.
- Similar process as in set 1 was repeated for the sets 2 and 3.
- In each set in Mathematics and Science, MC items were placed first, followed by other items.
- After reviewing each set of questions, a brief instruction for the students was prepared, and spaces for answers to all the CR items were arranged in the test paper.
- Six persons were assigned to develop a marking scheme with an answer key; generally, one set of questions was given to two persons.
- In the next round of workshop, all the sets were finalized with some formatting guidelines.

### **Preparation of the scoring scheme and guidelines**

A group of teachers and experts of the respective subjects worked for compilation, review and finalization of the scoring schemes for each subject. For multiple choice and other selected response (SR) types of items, answer keys were reviewed and reconfirmed. For created response types of items, the possible answers as well as marks to be provided in each step were reviewed and confirmed. For dichotomise items, conditions for 0 and 1 credit was clearly specified. For CR items with the partial credit conditions, each of the credits 0, 1, 2 and so on were clearly mentioned. Along with the preparation of scoring

scheme for each subject, some guidelines for scoring were also prepared. Particularly for writing test in the Nepali, rubrics were developed including score distribution in various skills of writing and levels of proficiency.

### **Review of test booklets and scoring schemes**

At the final stage of item selection and item booklet preparation, subject committee of each subject reviewed the items and item booklets with editing, confirming data, and formatting. The committees prepared the final test booklets which were then sent for preparing Printing Ready Copy (PRC). The subject committees also reviewed the scoring schemes.

While selecting the items and preparing the test booklets for the final test, the following principles were considered:

- **Curriculum based:** Content domains and criteria for the assessment were based on the learning objectives of the curriculum approved by the Government of Nepal. However, the assessment framework developed by ERO defines the standards and level of standards by analyzing the curriculum of not only Grade 8 but also of the other grades, particularly Grade 6 and 7. In this way, the assessment has focused on students' overall grade level competencies in each subject rather than just testing their curricular content-knowledge. While defining the six levels of standards– pre-basic, basic, proficient 1, proficient 2 and 3, and advanced— the hierarchy of knowledge, skills and competencies were arranged from lower to higher. As there were students with various levels of proficiencies, these levels would help to locate students' respective position.
- **Coverage of contents:** In order to cover the curricular contents, the items were prepared from different content areas. Similarly, multiple test booklets were prepared to cover the contents specified in the curriculum and criteria defined in the framework. The multiple booklets were calibrated in the same scale by using some linking items. While developing and arranging the test items, attention was paid to measure the competencies of each standard for each criterion.
- **Proper representation of various cognitive domains:** Following Bloom's revised taxonomy, the test items were developed and selected by ensuring the proper

representation of cognitive domains: remembering, understanding, applying and reasoning as defined in the assessment framework. Therefore, the selected items would measure the students' abilities in various cognitive levels.

- **Assessing the various levels of proficiencies:** Following the assessment framework, the test items were developed and selected to assess their levels of competencies. As the levels of competencies are hierarchical in nature, items were also developed and selected in similar manner.
- **Items having a range of difficulties:** Based on the pilot test results, items were analyzed by calculating their difficulty level. For this, the items were evaluated by calculating the item difficulty parameter (p-value). The items having a range of difficulties were included in the test; however, very difficult items (having less than 0.20 difficulty index) and very easy items (having more than 0.90 difficulty index) were generally excluded.
- **Proper discrimination power of the items:** Within the acceptable range of item difficulty, item discrimination was also calculated, and generally the items having 0.20 and more discrimination indexes (Point-Biserial correlation) were included for the final test. In some cases, subject experts, instead of rejecting relatively low discriminating items (discrimination index between 0 and 0.20), preferred slight revision of the test item. However, items having negative discrimination index were not used.
- **Comparability with previous NASA and TIMSS:** One of the objectives of this assessment was to compare the results with the previous NASA studies as well as TIMSS scale (for Mathematics and Science). For this, some items were used from the previous NASA studies as well as TIMSS Grade 8 Mathematics and Science test items. The parameters of these selected items were used to calibrate the items and equate the scores.

### **Preparation of item register**

Working with subject experts, ERO prepared an item register in each subject in an excel sheet. Item ID (unique), item descriptor for each item and scoring keys for MC items and various credits as well as description of each credit of CR items were included in the item register. The following is the example of an item register:

Table 3.15: Example of Item register (Mathematics, Grade 8)

SN	Item Id	Set A	Set B	Set C	Max score	Type	Key	Item descriptors	Cognitive_ level	Item level	Content Area	Source
20	M817_020	20	24		1	SR	A	Apply Pythagorean relation to determine the given triangle (with given lengths of the sides) as a right triangle.	Reasoning	2	Geometry	TIMSS, 2011
21	M817_021	21			1	SR	B	Convert simple rational fraction into decimal representation	Remembering	2	Arithmetic	TIMSS 2011
26	M817_026	26			1	SR	B	Find the best estimate of the given numerical expression of the fractional form in which both numerator and denominator are given in numbers containing decimal numbers or product of decimal numbers.	Remembering	3	Arithmetic	TIMSS 2011
27	M817_027	27			1	SR	D	Find true mathematical sentence (relation) of equality out of given expressions containing different operations	Remembering	3	Arithmetic	TIMSS 2011
28	M817_028	28	23		1	SR	D	Recognize the correct position of geometric figure (e.g. triangle) under half-turn (clockwise)	Understanding	3	Geometry	TIMSS 2011
29	M817_029	29			1	SR	A	Find the area of rectangular garden excluding the rectangular path in it, given the dimensions containing variable measures.	Applying	5	Algebra	TIMSS 2011
48	M817_048	48.1			1	CR	1	Calculate the mean for the given numbers(given number of things/persons)	Applying	4	Data and sets	TIMSS 2011
49	M817_049	48.2			1	CR	1	Find median for individual distribution (median number of things/persons)	Applying	5	Data and sets	TIMSS 2011

### **Designing OMR sheets**

Based on the three sets of test booklets for each subject, Optical Mark Recognition (OMR) sheets were designed for each set. Student background information from the questionnaire was also incorporated in the same OMR sheet. Similarly, teachers' background questionnaires for each subject were developed in a separate OMR sheet. Altogether nine OMR sheets for students in three subjects; three OMR sheets for teachers of three subjects; and one for head teachers were designed and printed out. The consulting firm with a technical person worked together with ERO to design the OMR sheets (see, Annex 1).

## **Background Information Questionnaires**

### **4.1 Introduction**

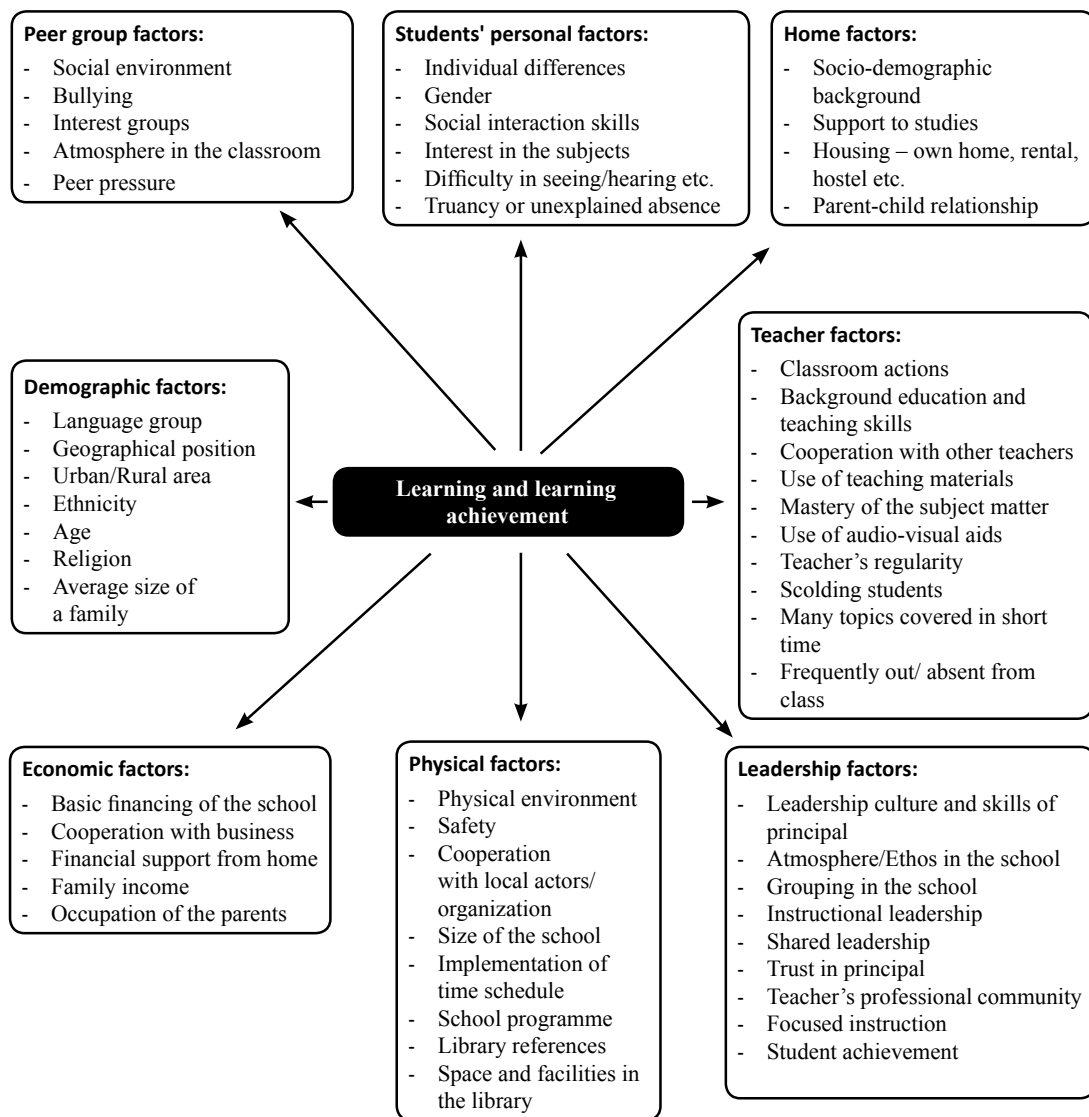

Achievement scores alone are not sufficient to explain the variation on students' performance, as several factors influence the achievement of students. Such contextual factors that affect the achievement of students need to be assessed as the integral part of the national assessment of student achievement. Assessment framework for NASA 2017 for Grade Eight also included a framework for contextual factors that can influence the achievement level of students. As the assessment of contextual factors, framework for three types of background questionnaires is suggested. They are: students' questionnaire, teachers' questionnaire and school survey questionnaire for head teacher. Based on the framework, background questionnaires for students, teachers and head teachers were also developed and administered along with test items, during the administration of test.

### **4.2 Framework for Background Information Questionnaires**

ERO developed the framework for background information questionnaires after studying students, teachers, and school survey instruments used in various international assessments such as Programme for International Student Assessment (PISA), Trends in International Mathematics and Science Study (TIMSS), and Pan-Canadian Assessment Program (PCAP) together with the tools used in previous NASAs conducted by ERO together with some discussions with academicians, practitioners, parents, teachers and students. Besides, student attitude scale used in previous NASA was revised and used.

The following figure shows the overall framework for background information questionnaires used in the study.

**Figure 4.1: Framework for the background information for NASA 2017**

Source: ERO, 2017, p. 84

The following factors were considered while developing and revising the questionnaires:

### Student questionnaire

Student questionnaire was used to collect the following information.

- Gender, age, home language

- Educational background of parents
- Socio-economic status of parents/family (SES)
- Home environment such as facilities, availability of books and other study materials
- Level of parental/family support for study
- Activities beyond the school hours/home
- School bullying
- Perception of classroom environment, such as sense of safety, friendliness of other students, support from teachers
- Teaching-learning process in classroom/school

### **Teacher questionnaire**

Teacher questionnaire was used to collect the following information.

- Gender, age, first language
- Teaching conditions including class size, access to resources, percentage of students having textbooks, access to substitute teachers in case of absence
- Educational experience, teacher qualifications and teaching experience
- Teaching-learning practice and conditions at school
- Professional engagement with learning, such as access to and interest in professional development, interest in teaching, and time spent on preparation for classes
- Availability of instructional support such as classroom visits and feedback by head teacher, school supervisor
- Teaching methodology, such as language of instruction, use of assessment, and style of teaching
- Satisfaction with working conditions, such as tenure, pay rate, and level of supervision
- Relationship between the school and community, such as interactions with parents, involvement in school committees
- Attitude of cooperation from students

### **Head teacher questionnaire**

Questionnaire for head teachers was used to collect the following information:

- Gender and age
- Educational and management experience and qualifications
- School environment, including the quality of buildings and facilities, as well as availability of resources
- School records, such as fluctuations in student number, student and teacher absenteeism
- Professional engagement of school leadership, such as access to and interest in professional development and interest in education
- Leadership style and use of time
- Assessment of teachers' work
- Satisfaction with working conditions
- Relationship with the community

### **Students' attitude survey**

In order to find the relation between attitude of students towards the subject and achievement, the attitude survey questionnaire was administered. The questionnaire was adapted from shorted version of FSMAS, Fennema Sherman Mathematics Attitude Scales (Fennema & Sherman, 1976). The attitude survey questionnaire was included in the students' background information questionnaire. The following are the statements used to identify the attitude of students towards the subject.

### **Self-confidence**

1. Studying mathematics makes me feel nervous.
2. I am always under a terrible strain in a math class.
3. I am able to solve mathematical problems without much difficulty.

### **Value**

4. Mathematics is important in everyday life.
5. Mathematics is one of the most important subjects for people to study.

6. High school math courses will be very helpful to me no matter what I decide to study.

### **Enjoyment**

7. I have usually enjoyed studying mathematics in school.
8. Mathematics is dull and boring.
9. I am happier in a mathematics class than in any other classes.

### **Motivation**

10. I would like to avoid using mathematics in college.
11. I am willing to take more than the required classes of mathematics.
12. I plan to take as much courses of mathematics as I can during my education.

Based on the above framework, the questionnaires for students, teachers and head teachers were developed. Several questions from previous NASA were adopted with some revision. During the development and revision of questionnaire, several discussions were carried out with parents, teachers, head teachers, students, educational managers and experts. Most of the questionnaires were set into 3 to 5 points Likert scale. Developed questionnaires were tried out with some students, teachers and head teachers from which some questionnaires were revised and finalized.

### **Socio-economic status (SES) survey**

The questionnaire to assess the socio-economic status of the family was included in the students' background questionnaire. The aggregate of the students' responses to the questions on the following seven factors indicates the SES of the student's family.

- Two variables related to parental education, including mother's and father's education;
- Two variables related to parental occupation, including mother's and father's occupation;
- Availability of various home accessories;
- Availability of home possessions; and
- Type of school (public or private) attended by student.

## **CHAPTER 5**

# **Test Administration**

### **5.1 Introduction**

Preparation for test administration begins with printing, packing and delivery of test items and background questionnaires. ERO conducted a one-day orientation on test administration and test booklet collection process to the head teachers of each sample school in 26 districts. With the help of two teachers, the head teacher of each sample school administered the test. Subject teacher and head teacher of the sample school (in which test was administered) filled teachers' and head teachers' questionnaires respectively. Then students' answer sheets as well as teacher's and head teacher's responses were collected in the scoring centre in Kathmandu. The process followed for the purpose of test administration is described in this chapter.

For completion of the works, some of the tasks of test administration were outsourced to a consulting firm, while others were carried out by DEOs and schools. On the whole, the sub-headings that follow will deal with the tasks and process adopted to accomplish the work of test administration of NASA 2017.

### **5.2 Printing, Packing and Delivery of Tools**

A consultancy firm, contracted by ERO, was given the responsibilities of printing, packing and delivery of tools, including: (i) three sets of item booklets in each subject; (ii) student and teacher questionnaires in each subject; and (iii) head teacher questionnaire. The consultancy firm was given these responsibilities in close monitoring of ERO. For this, ERO provided PRC copies of each tool to the consulting firm to print and pack them in a secure printing press.

Packing of item booklets for each sample school was done in a sequence of set 1, 2, 3 so that students sitting in an adjacent seat could receive different sets of questions of the same subject. As only one subject was administered in a school, packing of question of one subject was sufficient for a school. Besides, students' questionnaire for each participated

student, questionnaire for subject teacher and head teacher were also provided to each sample school.

### **5.3 Orientation to the District Focal Person**

An officer at each District Education Office (DEO) was assigned the role of focal person for ERO. ERO conducted a two-day orientation workshop for the focal persons of all the 26 districts selected for NASA 2017. The main focus of the orientation programme was to orient them with the process of test administration, roles of DEO, school (head teacher) and teachers who managed the test as invigilators, and the subject teachers of the sample school. Conducting orientation to the head teacher/teacher of the sample school, method of sampling the students at school, administration of test and questionnaires, collection of test papers and monitoring of test administration were the major areas covered in the focal person orientation programme.

### **5.4 Orientation to the Head Teacher/Teacher of the Sample Schools**

The consulting firm delivered the tools to the district headquarters of the sample districts in a secure manner. ERO provided District Education Office and the consulting firm with the list of sample schools and the number of students in each sample school. The District Education Office informed the sample schools about the date of test administration and participation of school head teacher/ teacher in the orientation programme. The focal person who participated in the one-day focal person orientation programme on test administration conducted this orientation programme. The head teachers/teachers from all sample schools of the districts participated in the orientation in which they were oriented on the details of their works in test administration. The consulting firm also supported for the orientation. In most of the districts an officer from ERO/MOE also facilitated the orientation programme. The orientation programme was concentrated on test administration process, student sampling method, questionnaire administration process and collection of questionnaires and test booklets. The questionnaires for head teacher, subject teacher and students and sealed test booklets were provided to each head teacher/teacher at the end of the orientation programme. A copy of test and questionnaire administration guidelines (see, Annex 2) prepared by ERO was provided to each school; and the details given in it was clarified during the orientation as well.

### **5.5 Test and Questionnaire Administration**

Test was administered in all the sample schools on March 2, 2017 (19 Falgun, 2073). The head teacher/teacher who had participated in the district level orientation programme was given the responsibility of orienting at least one additional teacher in their school. The teacher to be oriented in this way was one who was not currently teaching the subject (in which the test was conducted) in Grade Eight in the school. This teacher was oriented, in this way, towards the administration of test; and then the two teachers worked together in the sample school to administer the NASA test.

#### **Student selection for the test**

All students of Grade Eight in a sample school participated in the assessment if the number of students was less than or equal to the sample size fixed for the school. But, in the case of students' number remaining more than the fixed sample size, students in the required number were sampled randomly. Girls and boys were sorted separately and students were selected randomly for sample, so that girls and boys would be sampled almost in the proportion of their number in the class.

#### **Administration of background information questionnaire**

Students' background information questionnaire was administered first of all. The time estimated to complete the questionnaire by students was 30 minutes. This being the estimated time, some minutes more might be needed for some students if they did not complete. As mentioned in the test administration guidelines, teacher administering the test may support students by clarifying the questions for responding to the questionnaire. Thus, arrangement was made during the administration of the questionnaire to ensure that students would provide accurate response as they experienced in the home and school.

At the same time, head teacher and the subject teacher responded separately to the school survey questionnaire and teacher's questionnaire respectively.

#### **Test administration**

Test of only one subject was administered in a sample school, but there were three different test booklets (sets of test items) for each subject. Test booklets were distributed

alternatively in such a way that student sitting adjacent to each other (or nearby) would get different sets. With this arrangement, the students were unable to copy and discuss with each other (event if they wanted). And, teachers were not allowed to support students in answering the questions. In each booklet, sufficient spaces were given for the answer – not only for 'selected response' type of questions but also for the questions of 'created response' type. This message was communicated to the students before test administration. The test of each subject was of two hours in duration.

### **Collection of test booklets and questionnaires**

After the completion of test, students' test booklets and background information questionnaires responded by them were stitched together and packed in an envelope. Similarly, teacher's and head teacher's responses in the given questionnaires were packed together in an envelope. The unused test booklets were also packed in a separate envelope. Next, immediately, the three envelopes were packed in a separate packet and the packet was sealed writing necessary information, including name and code number of school, subject and grade of assessment, number of students participated, and number of unused test booklets in packing.

The school sent the sealed packet of answers and response papers to the respective DEO with the shortest possible means. Then the DEO handed the collected packets of answers and response sheets over to the representative of the consulting firm. The representative of the consulting firm packed all the packets received from schools and brought them to scoring centre in Kathmandu in a secure manner.

### **Monitoring of test administration**

To ensure proper administration of test, monitoring and sample school visits were made by different agencies during test administration. District Education Office not only managed the whole process of test administration, but also monitored the administration process at school level. ERO also sent at least one person in each district to facilitate and monitor the administration of test. Besides, the consulting firm also monitored the process of test administration.

## **CHAPTER 6**

# **Marking and Data Entry**

### **6.1 Introduction**

Scoring process started after all the answer booklets and questionnaires were collected at the scoring centre in Kathmandu. The booklets and questionnaires were sorted subject-wise before starting the task of scoring. For the purpose of marking and data entry also, the same consulting firm that worked in test administration process was contracted. This chapter describes preparatory works for scoring, which included preparation for scoring, scoring and transferring the scores and other data to OMR sheet, and OMR sheet scanning and data preparation.

### **6.2 Preparation for Scoring**

Scoring was an important task conducted in the course of NASA study. The process followed for this task is described below.

#### **Selection of scorers and scoring coordinators**

Bachelor's degree in the related subject was set as the minimum qualification for the scorer of NASA 2017 Grade Eight. In addition, some teaching experience, experience of scoring test papers, or some relevant training/short courses on item development and scoring was also essential for a scorer. Therefore, based on the required qualification and experience of the candidates, the consultant selected scorers, who were 30 persons in each subject to a minimum.

Along with selecting the scorers, the consulting firm also hired one scoring coordinator for each subject. The hired scoring coordinators had a minimum qualification of Master's degree in related subject with 10 years of teaching experiences or 5 years of experience in teacher training, assessment design and scoring, or working as a teacher educator for 5 years to a minimum. The main task of scoring coordinators was to maintain quality

and uniformity in scoring. The scoring coordinators supported the scorers in the task of scoring; and their work included giving orientation to the scorers and providing regular feedbacks to them by checking the papers they scored. In addition, scoring coordinators worked to ensure accuracy in OMR writing.

### **Training of scorers**

ERO, first, conducted a one-day orientation programme on scoring and OMR writing to the scoring coordinators and team leaders from the consultancy. In the next phase, ERO together with scoring coordinators conducted orientation to the scorers in each subject. The orientation programme was conducted in two stages – first for the scoring of CR items using marking schemes; and in the second stage, orientation was concentrated on OMR writing. During the training process, some practice and feedback sessions were also organized.

### **6.3 Scoring and Transferring Scores and Other Data to OMR Sheet**

The scorers scored CR items and then transferred the scores and the responses of SR items as well as responses on background information questionnaires (filled by the students) to the OMR sheet.

#### **Scoring of CR items using scoring schemes and guidelines**

Trained scorers scored the CR items using the scoring guidelines prepared in advance (see, annex 3). Scoring coordinators monitored the process of scoring and provided feedback as and when required. Subject experts from ERO also monitored and supported the scorers in scoring the items in a uniform manner.

#### **Transferring scores and other data to OMR sheet**

After scoring CR items, scores were transferred to OMR sheet. Along with the task of transferring scores to OMR sheet, the scorers also transferred the answers given by students on background information questionnaire in the same OMR sheet.

In the same way, responses on teachers' and head teachers' questionnaires were also transferred to separate OMR sheets.

#### **6.4 OMR Sheet Scanning and Data Preparation**

After reviewing the OMR sheets, each sheet was scanned using OMR scanner. The scanned OMR image was then transferred in the data set. In the data set there were two unique identifications (UIDs) given to each student: the barcode of each OMR sheet and school code (school ID) together with student ID.

Each OMR sheet of the responses of teacher's and head teacher's questionnaires was also scanned with two identifications: the barcode and school code (school ID). Then the scanned images were transferred into the data sheet.

Using these two IDs, errors in every the data set (if occurred at all) were corrected. This initial data cleaning task carried out by the consulting firm helped in correcting some errors on the data occurred due to various causes in OMR writing and data transferring process.

Finally, the consulting firm provided ERO with data set in excel format together with scanned image as well as hard copies of OMR sheets; and all the scored answer booklets and students', teachers' and head teachers' questionnaires with their responses, in the first week of July, 2017.

## Preparing for Data Analysis

### 7.1 Introduction

This chapter describes the steps and process of preparing data for analysis. It includes data cleaning and codebook preparation. Data cleaning is a process of improving data quality by identifying and correcting errors including checking duplicate cases, missing cases and invalid entries. Codebook, on the other hand, is an excel file prepared to document the items and their characteristics. It starts with placing unique item ID and mentioning some basic characteristics of items.

### 7.2 Data Cleaning

Data cleaning is a process of improving data quality. This process generally includes: Defining and determining errors (if any) and correcting them; checking duplicate cases and removing them; examining the missing cases; checking invalid entries and making decision on them. The following table presents the summary of data cleaning activities done for NASA 2017 grade Eight.

**Table 7.1: Summary of data cleaning**

Objective	Tasks performed
Remove duplicate case	- Checked and removed duplicate cases
Decide measures to be taken for invalid entries	- Checked and made decision on invalid entries, if any
Smooth noisy data	- Identified and removed outliers and nonsense values, if any - Resolved inconsistencies, if any
Fix the missing values	- Checked missing values and filled them up, or indicated missing if data are not found

Objective	Tasks performed
Check, fix and decide on any other error	<ul style="list-style-type: none"> <li>- Checked errors and identified if the errors are random or systematic</li> <li>- Corrected systematic errors</li> <li>- Checked random errors and identified the possible ways of correcting them or deciding how to deal them</li> </ul>
Fix variable and value labels	Checked variable and value level; then corrected and redefined them to make uniform
Make uniform structure of data	Checked structure of data and made them uniform for each of the data set Provided unique ID (UID) for an individual data

Students' data were received in three files for each subject – with one file for responses in each question set as well as the information on background variables, another for teachers response data on background information questionnaire and the third one for data on head teachers responses on school survey questionnaire. These data were in Excel file. The following variables were included in each data set of students.

**Table 7.2 : List of major variables**

S. N.	Variable
1	School Id
2	Location of School
3	Student's gender
4	Student's age
5	Language spoken at home
6	Caste/ethnicity
7	Identity with geography
8	Time spent on beyond school time
9	Support for study at home
10	Availability of textbook
11	Time to reach school
12	School opening and attendance days in last month
13	Homework and feedback

S. N.	Variable
14	Student's future aim
15	Attitude of student towards subject
16	Student's subject related activities in classroom
17	Mother's education
18	Mother's occupation
19	Father's education
20	Father's occupation
21	Number of family members
22	Home possession and accessories
23	Activities in leisure time at school
24	Frequency of extra activities at school
25	Frequency of participation in extra activities
26	Attitude towards teacher
27	Attitude towards school
28	Bullying at school

### 7.3 Codebook Preparation

A codebook was prepared in each subject with the help of subject experts. After the completion of data cleaning process, the cleaned data sets together with code book in each subject were prepared, which completed the initial preparation of data for calculation of item parameters, calibration, item and test analysis as well as further analysis of assessment results. The codebook includes basic information on items and variables. Item register and information on variables are basic components of codebook. Item register includes item ID for all the items of three sets of test, answer keys, domain to be tested by the question, cognitive classification of questions, type of question, content areas and item descriptors. The following is the format used for preparing codebook.

Table 7.3: Example of Codebook (Mathematics, Grade 8)

SN	Item Id	Set A	Set B	Set C	Max score	Type	Key	Item_descriptors	Cognitive_level	Item level	Topic	Source	Facility	Item-Rest Cor	Avg Delta
1	M817_020	20	24		1	SR	A	Apply Pythagorean relation to determine the given triangle with given lengths of the sides) as a right triangle.	Reasoning	2	Geometry	TIMSS 2011	55.52	0.51	-0.93
2	M817_021	21			1	SR	B	Convert simple rational fraction into decimal representation	Remembering	2	Arithmetic	TIMSS 2011	45.82	0.37	-0.04
3	M817_026	26			1	SR	B	Find the best estimate of the given numerical expression of the fractional form in which both numerator and denominator are given in numbers containing decimal numbers or product of decimal numbers.	Remembering	3	Arithmetic	TIMSS 2011	48.99	0.46	-0.20
4	M817_027	27			1	SR	D	Find true mathematical sentence (relation) of equality out of given expressions containing different operations	Remembering	3	Arithmetic	TIMSS 2011	63.03	0.40	-0.88
5	M817_028	28	23		1	SR	D	Recognize the correct position of geometric figure (e.g. triangle) under half-turn (clockwise).	Understanding	3	Geometry	TIMSS 2011	24.82	0.38	0.76
6	M817_029	29			1	SR	A	Find the area of rectangular garden excluding the rectangular path in it, given the dimensions containing variable measures.	Applying	5	Algebra	TIMSS 2011	26.70	0.11	0.93
7	M817_048	48.1			1	CR	1	Calculate the mean for the given numbers (given number of things/persons)	Applying	4	Data and sets	TIMSS 2011	17.80	0.56	0.93
8	M817_049	48.2			1	CR	1	Find median for individual distribution (median number of things/persons)	Applying	5	Data and sets	TIMSS 2011	19.65	0.49	0.97
9	M817_050	48.3			1	CR	1	Analyze the effect of increasing/decreasing the sum of the distribution by some number on the mean and median.	Reasoning	6	Data and sets	TIMSS 2011	27.50	0.63	0.34

## **Sampling Weights**

### **8.1 Introduction**

Sample weights are used to reduce biases in the sample caused by some imperfections in sampling including non-coverage and non-response. Sampling weights correct the imperfections in the sample so that biases and differences between the sample and the population could be minimized. Such imperfections are due to the selection of sample with unequal probabilities, non-coverage of the population, and non-response. The following are the main objectives of calculating and using sample weights:

- To compensate for unequal probabilities of selection;
- To compensate for non-response; and
- To adjust the weighted sample distribution for key variables of interest to make it conform to a known population distribution. (Yansaneh, 2003)

NASA 2017 adopted two-stage stratified cluster sample design with unequal probabilities of selection. Schools as well as students' non-response adjustments were also considered while calculating sample weights.

### **8.2 School Weight**

School level base weights were calculated using the formula:

$$BW_{sc}^i = \frac{N_{pop}}{n_{sc} \times N_{mos}^i}$$

where  $N_{pop}$  was the population size (students),  $n_{sc}$  was the total number of schools sampled within each explicit stratum; and  $N_{mos}^i$  was the measure of size (MOS) assigned to the school (i). School level base weights were calculated for all sampled schools that satisfied the condition that the eligible students actually participated in the study. For example, in mathematics, altogether 650 schools were sampled, out of which 1 school did not

participate in testing due to some unavoidable circumstance. For this, a school-level non-response adjustment was calculated separately for each explicit stratum, using the formula:

$$Sc_{adj} = \frac{n_{sc}}{n_{psc}}$$

where  $n_{sc}$  is the total number of originally sampled schools; and  $n_{psc}$  was the number of schools that participated.

The final school weight was then calculated with non-participation adjustment to the base school weight. The final school weight is then equal to the product of the school base weight and non-participation adjustment,

$$W_{sc} = BW_{sc}^i \times Sc_{adj}$$

### **8.3 Student Weight**

For schools with 28 Grade Eight students, student base weight was 1; and for schools with more than 28 students and fewer, the base weight was calculated using the formula:

$$BW_{st} = \frac{N_{st}}{n_{st}}$$

where  $N_{st}$  was the total number of students at Grade 8 in the sampled school and  $n_{st}$  were the number of sample students from the class.

A student non-participation adjustment was calculated for any school that had at least one student who was sampled and eligible to do the test but did not participate for some reason. This was calculated with the formula:

$$St_{adj} = \frac{n_{st}}{n_{pst}}$$

where  $n_{st}$  was the number of sample students and  $n_{pst}$  was the number of students who participate in the particular school.

The final student weight of a particular school (say,  $i^{\text{th}}$  school) is then equal to the product of the student base weight and non-participation adjustment:  $W_{st}^i = BW_{st}^i \times St_{adj}$

The final weight is the adjustment between the product of the school and student final weights:  $W_i = W_{sc}^i \times W_{st}^i$ .

## **CHAPTER 9**

# **Item Parameter Estimation, Item Review and Calibration**

### **9.1 Introduction**

Item parameter estimation of each item was carried out and items were reviewed accordingly. During the analysis, decisions were made on whether or not to use any particular item in the analysis. Classical as well as IRT parameters were estimated to review the items. Item parameters in IRT were used not only for item selection but also to estimate students' latent ability. Based on the item parameters of linking items, three versions of tests were calibrated and these three sets were made as a single set for analysis. Item parameter estimation, item review and calibration of test were some of the key processes of IRT analysis from which students' ability was estimated and data were further analysed.

### **9.2 Item Parameter Estimation**

#### **Preparation for test-by-test analysis**

To estimate item parameters and calibrate the items to the same parameters, item analysis was carried out using Item Response Theory (IRT). As three different versions of test were administered in each subject (Mathematics, Nepali and Science), individual versions were analyzed separately before calibrating these three versions of test in each subject. This was done to estimate item parameters. For this, Excel data files were transferred into SPSS file and test-by-test analysis of the three sets was carried out using Conquest software.

Before performing test-by-test analysis in Conquest, the following preparations were made:

- Checked and worked with unique item IDs, codebooks and data file with uniform

structure;

- Checked the matches of codes in codebook with the question paper;
- Checked the item register of all items and their linkages with item information;
- Checked and prepared the data set by making uniform structure;
- Ensured that items in the data set are in the same order as in the codebook;

### **Item review with test-by-test analysis**

The data files prepared in Excel were transferred into SPSS as data files; and created label files, command/syntax file for Conquest; and then test-by-test analysis was performed. As there were selected response (SR) type of multiple choice items (MC) as well as created response (CR) type of partial credit items, 1 PM model and Partial Credit Model (PCM) of IRT analysis was used in analysing the test.

One Parametric Logistic Model (1 PM), called Rasch model and the partial credit model (PCM; Masters, 1982) were used to estimate item difficulty parameters (calibrate/scale the items). The Rasch model is "a mathematical model for the probability that an individual will respond correctly to a particular item, given the individual's location in a reference domain or dimension" (OECD, 2016, p. 141). The model assumes that the probability of response  $x$  to item  $i$  by a respondent  $n$  depends only on two parameters, the difficulty of the item  $i$  ( $\delta$ ) and the respondent's ability or trait level ( $\theta$ ) where,

$$P(\theta, \delta) = \frac{e^{(\theta - \delta)}}{1 + e^{(\theta - \delta)}}$$

The expected probability of a correct response is equal to 0.50, at the point where  $\theta = \delta$ .

An example of item characteristic curve is presented below for the item number 4 (MC) of science, where the solid line is the expected model for the item, A is the correct response and others are distractors. As the students' response on correct answer follows the expected model and the responses on distractors do not, this question fit well in the model.

Figure 9.1 (a): An example of ICC for multiple choice items in Science subject (IPM)

The partial credit model is an extension of the Rasch model with more than two ordered response categories for an item (see, Masters & Wright, 1997). If  $\theta$  is the latent variable, and  $x$  the item score with values  $k = 0, 1, 2, \dots, m_i$ , the probability of person  $j$  scoring  $x$  on item  $i$  can be written as;

$$P_{ijx} = \frac{e^{\sum_{k=0}^x (\theta_j - \partial_{ik})}}{\sum_{h=0}^{m_i} e^{\sum_{k=0}^h (\theta_j - \partial_{ik})}}$$

where  $x = 1, 2, 3, \dots, m$ .

The following two figures, Fig 9.1(b) and Fig 9.1(c) are the ICCs for dichotomous response type (for item 5) and polytomous response type (for item 20) item respectively in Nepali subject.

Figure 9.1 (b): An example of ICC for dichotomous response type item in Nepali subject (PCM)

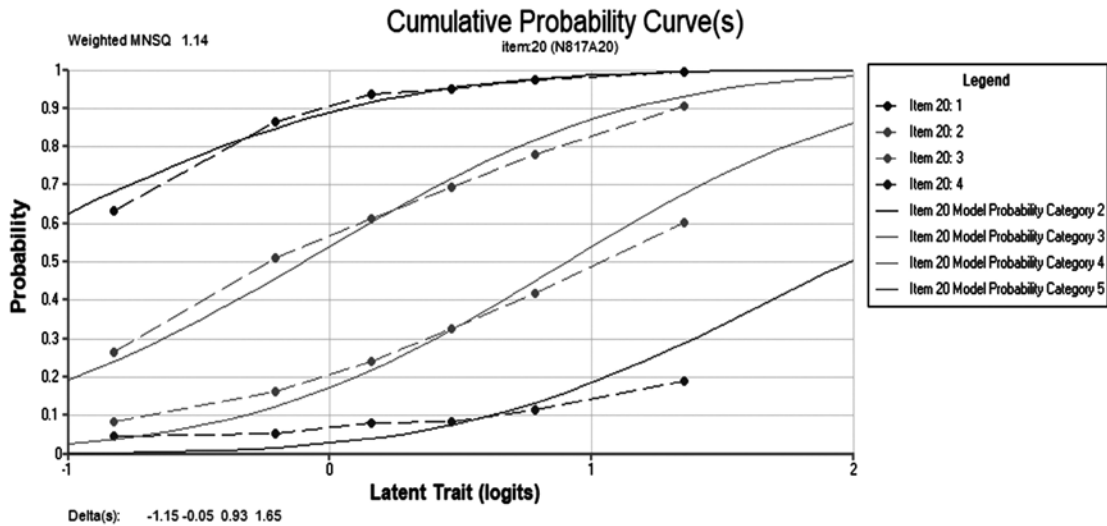

Figure 9.1 (c): ICC curve with polytomous response type item in Nepali subject (PCM)

The outputs of test-by-test analysis of each set of tests were reviewed item-wise, using item statistics and ICC (Item characteristic curve) for each item. Item statistics calculated for item analysis were item facility, item rest correlation (Point-Biserial correlation) and MNSQ.

The following table shows the example of a summary of item statistics as well as decisions on items in each test (set) for each subject. Items having negative item rest

correlations were excluded from the analysis. Items having the MNSQ from 0.8 to 1.2 with the items having 0.2 and above item rest correlation were first decided to include in the assessment. For the items having item rest correlation between 0 and 0.2, subject experts were consulted; and based on their suggestion decision was made on which item should be included or not in the analysis.

The above table shows the item statistics of the version 1 (set A) of Science Grade eight test booklet generated by test-by-test analysis. Item 15, 17 and 24, for example, have item rest correlation less than 0.20 but greater than 0. Subject experts' suggestion was taken into consideration for deciding whether these items should be included in or discarded from the analysis – whereby item 20 with item rest correction 0.065141641 which is less than 0.1 was discarded from the analysis and others were included. Similarly, items having less than 0.8 (items 32, 37, 39, 41, 43) and greater than 1.2 (item 25 with MNSQ 1.20340881) MNSQ were also reviewed by subject experts; and these items were not discarded.

Item parameters such as facility value, MNSQ (mean-square fit statistics) and item rest correlation were calculated for each version of test in each subject. Then the items parameter of all the versions of tests were stored in separate excel files for each test version in the name of parameter file.

### **9.3 Item Calibration and Equating**

The purposes of item calibration in this assessment were to join together the different versions of the test of the same Grade and subject; compare with the result of TIMSS by equating the test using linking items; and comparing the results with previous years' results of the same grade and subject.

As NASA 2017 used three versions of tests in each subject, reporting based on the number of correct responses or percentage of score is inappropriate. Three test versions in each subject administered in NASA 2017 may not be necessarily parallel and may have different levels of difficulty; and therefore reporting the total or percentage of scores and comparison of student competencies could be meaningless. In order to overcome such limitations of reporting test results using Classical Test Theory (CTT), an alternative test theory – Item Response Theory (IRT) has been followed for equating. Equating is a process of identifying some regularity in response pattern (difficulty) and modelling such regularity for the test, which can be used to describe students' abilities as well as items in terms of a common scale, even if all students do not take identical sets of items (OECD, 2017). This type of calibration of items and scaling of test will make possible to interpret the results using a common scale.

There are three commonly used methods for item calibration and equating: (i) Concurrent analysis, (ii) Anchoring method, and (iii) mean shift method. Among the three methods, concurrent analysis was used to calibrate the items in this assessment. This calibration is also known as joint scaling or equating, which is widely used for equating among various booklets with rotated design within a Grade or among the groups having similar abilities. Three sets of questions were merged into one set through concurrent analysis – by using the average of the parameter of common/linking items for calibrating, for the first two booklets (booklets 1 and 2) first, and then for the last two booklets (booklets 2 and 3).

Using the output of concurrent run (item parameters as well as ICC) items were reviewed for model fit, and inefficient or violating items were deleted. Thereafter, next run was performed for the remaining items after deleting inefficient and violating items. A scale was created for item parameters from the outputs of concurrent analysis.

The tables 9.2, 9.3 and 9.4 below present the item statistics after calibration of items from three booklets into one in Mathematics, Nepali and Science respectively.

## 9.4 Case Estimation

Using the parameters of the concurrent analysis, Weighted Likelihood Estimation (WLE) was performed to estimate cases. WLE is the estimation of students' individual ability scores-latent ability ( $\theta$  value) in logits, which has the value of 0 as the mean ability, positive for above average and negative for below average. Merging this file with student data set gives individual ability score in logits, called case estimation. Latent ability is the estimation of latent trait of the student based on the obtained score in relation to the items having certain characteristics. It is a transformed score (theta) with a mean of 0 and a standard deviation of 1 with some range to cover the latent trait to be measured.

**Table 9.5: Example of student ability from WLE (Grade 8 Nepali)**

The following figure shows the item-person map, which place items (with difficulty scale) and persons (with their latent ability) in the same scale. The vertical scale in the figure shows increasing proficiency that is student ability distribution on the left side, whereas the items are located on the right side in the order of difficulty of items with the easiest items at the bottom.

**Figure 9.2: Item-person map of Grade 8 in Nepali**

The above figure shows that the items cover a wide range of difficulty levels with the average item difficulty ( $\delta$  value) and the average ability ( $\theta$  value-zero logit), which shows that item difficulty and person's ability are matching quite well.

The case estimation using WLE explains the individual student's ability fairly, but it may not be appropriate for population estimation.

## **Generating PVs for Population Estimation**

### **10.1 Introduction**

This chapter presents the method and process adopted for estimating the assessment results for the whole population. The method used for population estimation is the calculation of plausible values, which is described in this chapter. The possible errors that occur while estimating the population were estimated using replicable techniques. Replication methods draw multiple replicates (sub-samples) from a full sample as per specific re-sampling scheme. Among different methods of replication, Jackknife method has been used in this assessment. The method and process of calculating replicable weights and estimating standard errors are also discussed in this chapter.

### **10.2 Plausible Values (PVs)**

For population estimation, Plausible Values (PVs) were generated with the sample weight of students. It produces unbiased estimate of population parameters if assumption of scaling are reasonable, but it is not fair to use for level of student ability. As Yamamoto & Kulick (2000) mention, the PVs approach "uses students' responses to the items together with all background data in order to estimate directly the characteristics of student populations and sub-populations" (cited in Laukaitytė, 2016, p. 9). But, PVs are not individual test scores; they are the measures of the performance of population.

The following inputs were prepared to generate the PVs:

- Case estimation using weighted likelihood estimation (WLE)
- Student sample weight
- Dummies for background variables
- School index
- School mean
- Count

Performing conditional run with the student data 5 PVs were generated.

Table 10.1: 5 PVs and RWGT (example from Grade 8 Mathematics)

### 10.3 Regression Model and Population Modelling

An IRT model together with a regression model was used in NASA 2017 data analysis. To increase the accuracy of the estimation of proficiencies of population and sub-populations, plausible values methodology or the multiple imputations method was used. For the purpose of population estimation, 5 plausible values were computed to each student. The combined model used in NASA 2017 as in PISA 2015 (OECD, 2017) includes IRT measurement modelling to provide information about test performance and the latent regression to provide information about predictability of proficiency by the background variables. The following combined model was worked out for population estimation:

- **Item calibration (equating) using IRT:** Items of test were of both SR (MC) and CR types. CR type items were of both dichotomous and polytomous response types. For this, one parametric logistic/Rasch model (1 PM) and a Partial Credit Model (PCM) of IRT were used to estimate parameters and to calibrate the items of various versions in a common scale.
- **Latent regressions and plausible value generation:** A latent regression model has been set to the data to obtain regression weights for population estimation. Similarly, 5 plausible values were generated for each student using the estimated item parameter.
- **Variance and standard error estimation:** Using replicates approach, variances and standard error of population estimation were calculated for required variable.

### 10.4 Replicable Weight and Standard Errors

Replication methods have been used for estimating sampling errors in a complex survey design. Replication methods draw multiple replicates (sub-samples) from a full sample as per specific re-sampling scheme. Among different methods of replication, balanced repeated replication (BRR) method and the Jackknife method have been used most commonly.

In this assessment sampling errors or variability was estimated using Jackknife repeated replication (JRR) method. Jackknife repeated replication (JRR) is a method to estimate the sampling variability of the sample design, which provides unbiased estimates of the sampling error. It was done by splitting a single sample into multiple sub-samples and using fluctuation among the sub-samples, the overall sampling variability was estimated.

The following three steps were followed to find the variability using JRR:

- Formed random groups from the sample schools (Primary Sample Units -PSUs);
- Constructed the replicate weights, which were later used to calculate the parameter of interest for the sub-samples; and
- Calculated variance of the parameter of interest.

To form the replicate weight, first of all the schools were organized into pairs in the order they were sampled. Replicates were formed by altering one of these pairs in turn where one randomly selected school from the pair was dropped and the weights for the schools were doubled; and the weights for the other sample schools were unchanged. Based on the number of schools participated in the assessment, replicates were formed in each subject.

For NASA 2017, 324 replicates were formed in Mathematics, and the same number of replicates was maintained in Nepali subject. In Science there were 326 replicates as there were 649 participating schools in Mathematics and Nepali each; and 652 schools in the case of Science.

Replicate weights, therefore, were used to estimate the standard error of population estimate. As the population is stratified into various strata,  $JK_2$  was used to calculate variance, which is

$$\sigma^2 = \sum (\theta_i - \theta)^2, \text{ where}$$

$$\text{or, } \sigma = \sqrt{\sum (\theta_i - \theta)^2}$$

And

$$SE = \frac{\sigma}{\sqrt{n}} = \sqrt{\frac{\sum (\theta_i - \theta)^2}{n}}$$

SE is the standard error,  $\sigma$  is the standard deviation and  $n$  is the number of samples.

The confidence interval (CI) can be calculated using the formula,

$$CI = \text{mean} \pm z \times SE$$

$$= \text{mean} \pm z \times \frac{\sigma}{\sqrt{n}} = \text{mean} \pm 1.96 \times \frac{\sigma}{\sqrt{n}} \text{ (for 95\% confidence level, } z = 1.96 \text{ standard score).}$$

## **Estimation of Students' Abilities**

### **11.1 Introduction**

The main purpose of using Item Response Theory (IRT) in an assessment is to estimate students' ability and locate that person on the ability scale. For ability estimation, first, the examinee should be evaluated in terms of how much underlying ability he or she possesses. Secondly, comparisons can be made among the examinees for various purposes (Beker, 2001). As test is an indirect measure of latent trait (ability) of a student, there are several methods of estimating the ability. The maximum likelihood (MLE), the weighted maximum likelihood (WLE), and the maximum a posteriori (MAP or BMLE) have been widely used to estimate students' ability in using IRT. In NASA 2017 of Grade Eight, ERO used WLE method to estimate the ability of students.

Case estimation, as presented in chapter nine of this report, is an estimation of sample students' abilities (Theta value) in logits, but the students' abilities to be discussed and estimated in this chapter are the estimation of the abilities of student population.

### **11.2 Scale Transformation**

In order to facilitate the interpretation, the logit score ie. ability scores (Theta value) was transferred into score having 500 as mean score with 50 as standard deviation. One of the reasons of choosing this scale is to avoid negative values on the scale of proficiency in which a standard deviation of 50 gives how far is a certain proficiency level from the mean. The transformation formula used to transfer logit score to the proficiency scale was:

$$\text{Score on proficiency scale} = \text{Logit} \times \text{standard deviation} + \text{mean score} = \text{Logit} \times 50 + 500.$$

The logit score is based on the NASA 2017; and therefore, it could be taken as base score so that we can compare this value with the score of previous years or the assessments to be done in the coming years using some linking items and scaling the scores with the

parameters of NASA 2017.

Here, mean of 500 is fixed as the national mean, which was calculated using student sampling weights to present the average achievement of all Grade 8 students of Nepal in respective subjects.

When we prepare item map with students' ability score, it indicates the situation: "If a student's proficiency level exceeds the item's demands, the probability that the student can successfully complete that item is relatively high, and if the student's proficiency is lower than that required by the item, the probability of success for that student on that item is relatively low" (OECD, 2017, p. 279).

### **11.3 Proficiency Scales**

The reporting scale of NASA 2017 is proficiency scale as the proficiency describes what students typically know and can do at given level of proficiency. It reports the results for population-level but not for individual students – assuming that the selected sample of grade 8 students will represent all the grade 8 students of Nepal. Results from statistical analysis were transformed in the scale score with 500 as the mean score (proficiency); and it was then reported by dividing proficiency scores into six levels. There is specific proficiency description to each level of proficiency defined on the basis of competencies described by item descriptors (see, Zieky & Perie, 2006).

Comparison of student achievement against the proficiency levels is a convenient way of describing student achievement. Students having a certain level of proficiency are able to demonstrate the understandings and skills associated with that level. Any student within a band/level would be expected to successfully answer at least 50% of items in a test. In general, the proficiency scale shows that the students whose ability estimate places them at a certain point on a proficiency scale would be more likely to be able to successfully complete tasks at or below that point (OECD, 2017).

The width of each band/level, except for the highest and lowest band/level, has been uniformly distributed. The cut points for proficiencies were decided from the students' score together with subject experts' judgment based on item descriptors.

## Proficiency levels for mathematics Grade 8

Five cut-points were decided for 6 proficiency levels in mathematics. In mathematics of NASA 2017, two extreme levels were taken – the lowest and highest level with below -2 and above +2 logits. This yields the lower and higher levels of proficiency in mathematics below 395 and above 606 respectively. Computing 4 levels of proficiency of score from 395 to 606 (score range 211), we get 52.75 as the width of each of the four levels. Table 11.1 presents the range of scores in each level of proficiency and Table 11.2 describes each proficiency level by stating what students can typically do at certain level.

**Table 11.1: Proficiency levels and the score range in Mathematics**

Level	Score	SE
Level 6 (Advanced)	606 <	0.13
Level 5 (Proficient 3)	553–606	0.72
Level 4 (Proficient 2)	501–553	1.01
Level 3 (Proficient 1)	448–501	0.9
Level 2 (Basic)	395–448	0.79
Level 1 (Pre-basic)	< 395	0.33

**Table 11.2: Summary descriptions of the six proficiency levels on Mathematics scale of Grade 8**

Level	Score	What students can typically do
6	606 <	Students at level 6 can analyse, synthesize and show relationship among different mathematical concepts. They can analyse the pattern and get the solution in unfamiliar problems in some content areas. For example, they can find the angles of a triangle by using the angle relationship of isosceles triangles; and analyse the effect of increased/decreased distribution by some numbers on the mean and median; transfer a geometric figure using multiple transformations.
5	553–606	Students at level 5 can solve daily problems using learnt mathematical concepts and analyse the problems and synthesize the process of solving mathematical problems. They can solve varieties of problems of their level. For example, they can solve

Level	Score	What students can typically do
		verbal problems of simultaneous equations; use the formula of $(a^3+b^3)$ to factorize algebraic expressions; calculate the area of the given right triangle; simplify the algebraic fractions with different denominator and indices; find the number when two numbers are given in different base of number (binary and quinary); solve the verbal problems on finding cost price when marked price and discount are given; find the cardinal number of the intersecting sub-sets, complement; solve the simple problems using angle sum relation of a triangle, co-interior angles, alternative angles and corresponding angles formed by the parallel lines; use mean and median in solving daily life problems.
4	501–553	Students at level 4 can apply the different mathematical concepts to solve simple problems. For example, student can use four simple operation to simplify expression; round off a decimal number; convert the decimal number into the number having other bases; solve the problems of profit and loss involving discount and percentage; rationalize the denominator of irrational number; solve very simple problems on unitary method/time and work; solve the linear and quadratic equation; find HCF and LCM of two algebraic expressions of degree 2, construct a square and other shapes with the given length using compass and scale; find the image points of a given point using transformations (reflection, rotation and translation); find the distance between two points by using distance formula; deduce the relation to find an exterior angle of a n-sided regular polygon; find the union/intersection of two sets using Venn diagram; identify the rational and irrational numbers; find mean and median of discrete series; explain the angle sum relation of a triangle, relation between co-interior angles, alternative angles and corresponding angles formed by the parallel lines..

Level	Score	What students can typically do
3	448–501	Students at level 3 can apply the limited mathematical concepts in solving problems and they can plan how to gather data necessary to solve simple problems. For example, they can calculate area; volume and length of a cube or cuboid; calculate radius from diameter of a circle; use Pythagorean triples; explain the conditions of congruency of triangles, convert different units of measurement; rationalize the denominator of a fraction; calculate the simple interest using formula; solve linear equation of one variable and two variables; simplify the monomials, identify union, intersection and complement two sets, factorize algebraic expressions using $a^2 - b^2$ ; identify images after reflection, translation and rotation, find the mean and median of individual series.
2	395– 448	Students at level 2 can describe basic mathematical concept and relations, and calculate simple results using these concepts and relations. For example, students recognize congruent triangles, recognize rectangle, square and parallelogram, identify the pair of angles between parallels, calculate profit and loss percentage from verbal information, multiply simple index numbers convert rational and decimal to each other, identify regular polygon, solve linear equation of one variable.
1	< 395	Students at level 1 have very rudimentary understanding on mathematical concepts such as integers, fraction/decimals, percentage and operations as they perform very basic and only few direct calculations of results, mostly learnt in previous grades. For example, students of this level recognize two dimensional geometric shapes and three dimensional objects; add/subtract polynomials; multiply/divide monomials, calculate profit when cost price and selling price are given.

### Proficiency levels for Nepali in Grade 8

In the same way, proficiency scale for Nepali was computed by taking the lower and higher levels of proficiency below 383 and above 605 respectively. Computing 4 levels of proficiencies of score from 383 to 605 (score range 222), we get 55.50 as the width of each of the four levels together with two extreme levels – below 383 and above 605. Table 11.3 presents the range of scores in each level of proficiency and Table 11.4 describes each proficiency level by stating what students can typically do at certain level.

**Table 11.3: Proficiency levels and the score range in Nepali**

Proficiency Level	Score	SE
Level 6 (Advanced)	605 <	0.038736
Level 5 (Proficient 3)	549–605	0.530654
Level 4 (Proficient 2)	494–549	0.759241
Level 3 (Proficient 1)	438–494	0.733396
Level 2 (Basic Level)	383–438	0.315963
Level 1 (Pre-basic)	< 383	0.126922

**Table 11.4: Summary descriptions of the six proficiency levels on Nepali Scale of Grade 8**

Level	Score range	Description
Level 1	<383	दिइएका अनुच्छेदको सीमित बोध गरी अनुच्छेदबाट सोधिएका के, कहाँ, को र कुन जस्ता सरल र सोझो उत्तर आउने प्रश्नको उत्तर दिन, सूची तयार गर्न र साधारण घटनाको क्रम मिलाएर सार्न ।
Level 2	383-438	अनुच्छेदमा प्रयुक्त सूचनाको सामान्य बोध गर्न तथा सूचनाको पहिचान गरी सो का आधारमा प्रश्नको उत्तर दिन । नक्सामा प्रयुक्त चिन्हका आधारमा सही सूचना पहिचान गर्न । साधारण र सरल प्रकारका वाक्य वाक्य लेखन गर्न ।
Level 3	438-494	अनुच्छेदको बोध गरी सोधिएका प्रश्नको कारण सहित उत्तर दिन, अप्रत्यक्ष सूचना पहिचान गर्न, सरल शब्दहरूको पर्यायवाची शब्द पहिचान गर्न, निर्देशन अनुसार ढाँचा मिलाई सामान्य स्तरको निर्देशित लेखन तथा सामान्य वाक्य रचना गर्न ।
Level 4	494-549	अनुच्छेदको मुख्य विषय आसय पत्ता लगाउन । उपयुक्त शीर्षक चयन गर्न । निर्देशित जीवनी, प्रबन्ध/निबन्ध, कथा लेखन । संवाद पूरा गर्न । दिइएका वाक्यमा उपयुक्त चिह्न प्रयोग र शुद्धाशुद्धि मिलाउन । चिठीको सामान्य स्तरको प्रत्युत्तर लेखन र सामान्य स्तरको निवेदन तयार गर्न, चित्रको सामान्य लिखित वर्णन गर्न तथा वादविवादको विषयमा सामान्य तर्क प्रस्तुत गर्न ।

Level	Score range	Description
Level 5	549-605	दिइएका घटनाका आधारमा साधारण समाचार र निर्देशित कविता तयार गर्न । अनुच्छेदको विषयवस्तुको बोध सहित तुलना गर्न, सो अनुसार तर्क दिन, मूल्याङ्कन गर्न । अनुच्छेदको सारांश लेख्न । उपयुक्त चिह्नको प्रयोग सहित व्याकरणिक रूपमा शुद्ध वाक्य रचना गर्न ।
Level 6	605 <	अनुच्छेदको पूर्ण बोध गरी त्यसमा प्रयुक्त पारिभाषिक/प्राविधिक शब्दको सन्दर्भगत अर्थ बताउन, अर्थ खुल्ने गरी वाक्यमा प्रयोग गर्न तथा उच्चस्तरीय व्यवहारिक लेखन क्षमता प्रस्तुत गर्न ।

### Proficiency levels for science in Grade 8

Similarly, proficiency scale for Science was also computed by taking the lower and higher levels of proficiencies below 390 and above 575 respectively. Computing 4 levels of proficiencies of score from 390 to 575 (with the score range of 185), we get 46.25 as the width of each of the four levels together with two extreme levels – below 390 and above 575. Table 11.5 presents the range of scores in each level of proficiency and Table 11.6 describes each proficiency level by stating what students can typically do at certain level.

**Table 11.5: Proficiency levels and the score range in Science**

Level	Score	SE
Level 6 (Advanced)	575<	0.158
Level 5 (Proficient 3)	529-575	0.643
Level 4 (Proficient 2)	482– 529	0.829
Level 3 (Proficient 1)	436– 482	0.830
Level 2 (Basic)	390-436	0.692
Level 1 (Pre-basic)	<390	0.159

**Table 11.6: Summary descriptions of the six proficiency levels on Science Scale of Grade 8**

Level	Score	What students can typically do
6	575 <	Students of level 6 can analyse and justify the solution of complex problems in Science; such express the complete information about revolution period of moon and justify the reason behind redness of the sun during early morning.

5	529-575	Students of level 5 can apply the learnt concepts and relations in solving problems in a new situation, and analyse the solutions. For example, apply the concept of atmospheric pressure, cause of refraction of light and express the boiling point of water at sea level in Fahrenheit; state Mendeleev's periodic law, name of liquid metal, write molecular formula, use of sodium hydroxide and name of zero group of element. Reaction of vinegar and sodium carbonate. Draw a labelled diagram of life cycle of flowering plant and plant cell. Explain the importance of wild life conservation, relation of weather and climate, cause of growth of plant
4	482— 529	Students of level 4 have adequate knowledge and skills in science; they can describe the some complex concepts, and use basic concepts and relations in Science to solve the problems. For example, calculate the volume of irregular object and potential energy, analyse the relation of echo and distance, effect of temperature on gaseous molecule, sound produced by metal and non-metals Compare the image formed by plane and spherical mirror, new and full moon, open and closed circuit and wave length of two waves. Describe global environmental problems as acid rain, climate change and greenhouse effect. Analyse the relation of Carbon dioxide and photosynthesis; explain atomic structure, distinguish acid and base and write molecular formula of acids, bases and pollutant gases. Find molecular weight; describe the method of removing hardness of water Draw labelled diagram of animal cell and cubical epithelium and write function of cell organelles. Distinguish plant cell and animal cells, androecium and gynoecium, classify animals and plant, explain biodiversity, evolution of life and, describe the relation among cell, tissue and organ. Function of condenser in distillation; mention the type of asexual reproduction in mushroom and importance of vegetative propagation.

3	436— 482	Students of level 3 have basic knowledge and skills in Science; they can state and use concepts and simple relation in solving direct problems in science. For example, write the formula of relative velocity, calculate the distance by using equation of motion, explain the relation of height and atmospheric pressure, define, soft water, ore, work and mechanical advantage. Recall the atomic number, define select the method of separation of mixture classify lever, write relation of liquid pressure and density, Use method of conserving magnetic strength, distinguish heat and temperature, apply the concept of fundamental unit; write the conditions for seed germination, state reproductive part of a plant and write location of epithelial tissue, analyse the impacts of air pollution and soil erosion, write effects of monsoon, sustainable development, economic importance of forest and name of national parks of Nepal. Classify planet and satellite and name the climatic zones of Nepal.
2	390- 436	Students of level 2 have some basic scientific knowledge and skills of the grade level; they can define and state some of the terms and concepts in Science such as define acceleration, name the largest planet, and enlist factors for environmental degradation, example of medicinal plant and most useful metal for ornaments.
1	390	Students at level 1 have basic prerequisite knowledge and skills of recognize and recall the simple information and objects. For example, recognize medicinal plants; instruments used to measure length, mass, weight and time; define magnetic induction, distance, displacement, density of substances; give examples of different classes of lever, work and forms of energy, types of energy; list out the sources of heat, cell, acid, base and salt, natural resources and environment degradation; identify the use of metals in daily life, functions of different parts of plants and name of the members of solar system.

## **CHAPTER 12**

# **NASA 2017 Results**

### **12.1 Introduction**

At the final stage of data analysis, subject-wise results of NASA were prepared. The results include basic results which cover proficiency definition and range of scores in each proficiency, provincial mean score and percentage of students in various proficiencies. Next, results based on the background variables were analysed in each subject. The analysis process is described in this chapter, but the main tables of results are included in annex (see annex 5).

### **12.2 Basic Results**

As the basic results of NASA 2017 of Grade 8 students, the results in Mathematics, Nepali and Science are classified into six proficiency levels based on the transformed ability score – with 500 as the national mean. Average score of each province for each of the three subjects is also calculated and compared with the national mean. Using sample weights and reapplication, these results were estimated at population level.

### **12.3 Background Variables and Results Based on these Variables**

After performing data cleaning and preliminary analysis, descriptive statistics were calculated for students' background variable related questionnaire in each subject. We calculated frequency, percentage distribution as well as mean and standard deviation for all items. Missing data were coded with 9. Next, factor analysis was carried out for some of the variables. Finally, correlational analysis was performed between student achievement and given background variable to explain the level of effects of background variables in students' achievement.

Results of every subject were generated separately in relation to several influencing factors of students' results. These influencing factors were taken from the variables included in

the student background questionnaire. First, frequencies were calculated to each of the categories of background questionnaire (see Annex 4), and then based on the frequencies the mean scores of selected categories were calculated (see Annex 5) and compared. Results in each subject were presented in the following variables with selected categories.

- 1 Geographical location of School
- 2 Students' gender
- 3 Students' age
- 4 Language spoken at home
- 5 Caste/Ethnicity
- 6 Identity with geography
- 7 Time spent on beyond school time
- 8 Support for study at home
- 9 Availability of textbook
- 10 Homework and feedback
- 11 Students' future aim
- 12 Attitude of student towards subject
- 13 Student's subject related activities in classroom
- 14 Mother's education
- 15 Mother's occupation
- 16 Father's education
- 17 Father's occupation
- 18 Home possession and accessories
- 19 Activities in leisure time at school
- 20 Attitude towards teacher
- 21 Attitude towards school
- 22 Bullying at school

#### **12.4 Comparing the Overall Results of NASA 2017 with the Results of 2013**

NASA 2013 score of Grade 8 is compared with NASA 2017 based on the Classical Test Theory (CTT), percentage of correct answers (p-value or facility index), using score of linking items, the raw scores of both NASA tests (2013 and 2017) of the linking items were transformed into z-score with zero mean. Then the standardized score was shifted into mean 500 and standard deviation 50, total for all students.

It should be noted that this comparison is based on the sample data. The data has not been weighted for the population, and result is based on linking items.

## **12.5 Provincial Results**

Provincial results are prepared separately in each subject. The provincial results provide the opportunity of comparing the results in major variables. In each subject, provincial report begins with comparing overall mean scores of provinces and then presents the mean scores in relation to various influencing variables on the achievement of students.

### Annex 1: OMR sheet (Example: Science set 2)

[illegible]

## Annex 2: Test Administration Guidelines

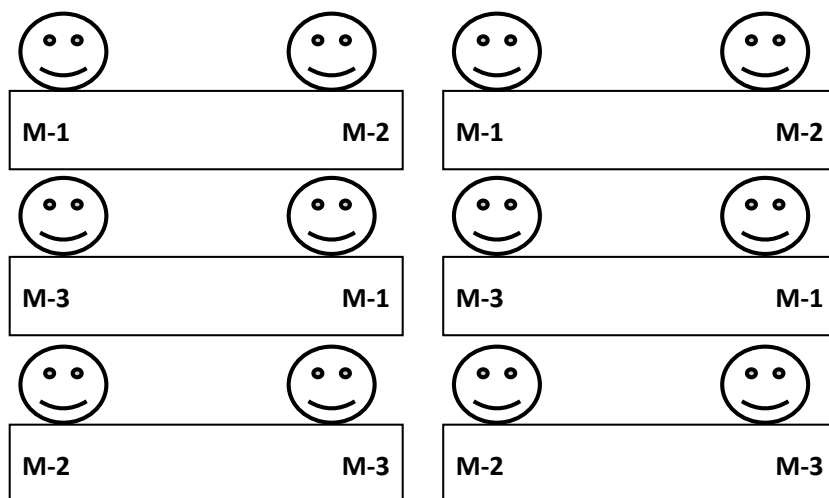

### विद्यार्थी उपलब्धिको राष्ट्रिय परीक्षण, २०७३ (कक्षा ८) सञ्चालनका लागि प्रधानाध्यापकलाई मार्गदर्शन

विद्यार्थी उपलब्धिको राष्ट्रिय परीक्षण, २०७३ (कक्षा ८) सञ्चालनका लागि प्रधानाध्यापकले निम्नानुसारको व्यवस्थापन तथा सहजीकरण गर्नु पर्नेछ :

१. परीक्षण २०७३ फागुन २१ गते दिनको ११ देखि १ बजेसम्म तोकिएको विद्यार्थी सङ्ख्यामा सञ्चालन गर्नु पर्ने छ ।
२. यो परीक्षणले विद्यार्थीलाई पास/फेल गर्ने वा शिक्षक/विद्यालयको मूल्याङ्कन गर्ने नभई विद्यार्थीले दिएका उत्तरका आधारमा सिकाइ उपलब्धिको राष्ट्रिय स्तर निर्धारण र शैक्षिक सुधारका लागि सहयोग गर्दछ । यस परीक्षणबाट विभिन्न आधारमा उपलब्धिको तुलना गर्न, सिकाइका कारक तत्वहरू पहिचान गर्न र सिकाइ उपलब्धि न्यून तथा उच्च भएका विद्यालयका बीचमा भएका भिन्नताहरू पहिचान गर्न सहयोग पुग्दछ । परीक्षणको यस्तो महत्वलाई ध्यान दिई यो परीक्षणमा विद्यार्थीले जानेका कुरा सही, स्वच्छ एवम् मर्यादित रूपले लेख्ने वातावरण सिर्जना गर्नु पर्नेछ ।
३. प्रश्नको उत्तर दिनका लागि विद्यार्थीलाई कसैले पनि सिकाउने वा सघाउने गर्न हुदैन भने विद्यार्थीहरूले पनि परीक्षण अवधिमा आपसमा कुराकानी तथा छलफल गर्न हुदैन ।
४. यस परीक्षणमा प्रश्नावलीको गोपनीयता अत्यन्तै महत्वपूर्ण पक्ष हो । कुनै प्रश्नपत्र विद्यालय वा शिक्षकले राख्ने, कुनै प्रश्न वा प्रश्नपत्र कुनै माध्यमले सार्ने वा कपी गर्ने, फोटो खिच्ने वा फोटोकपी गर्नेजस्ता कुनै पनि कार्य गर्न हुदैन । शैक्षिक गुणस्तर परीक्षण केन्द्र (ERO) द्वारा विद्यालयलाई उपलब्ध गराइएका प्रश्नपत्रहरूमध्ये केही प्रयोग नभएमा सुरक्षित साथ प्रश्न प्राप्त भएकै खाममा खामबन्दी गरी पठाउनु पर्नेछ । प्रश्नावलीहरू हराएमा, फोटो खिचिएको वा फोटोकपी गरी राखिएको पाइएमा संलग्नलाई नियमानुसार विभागीय कारवाही हुने पक्षमा सचेत गराउने, प्रयोग भएका र नभएका सबै प्रश्नावलीहरू अनिवार्य रूपमा गन्ती गरी फिर्ता गर्नु पर्नेछ ।
५. परीक्षण सञ्चालन भएको समयमा सम्बन्धित विषयको विषय शिक्षक परीक्षण सञ्चालन भएको कक्षामा प्रवेश नगरी अन्य शिक्षकहरूबाट परीक्षण सञ्चालन गर्नु पर्नेछ । तर विद्यालयमा जुन विषयको परीक्षण सञ्चालन हुने हो सो विषयको शिक्षकले नै शिक्षक प्रश्नावली भर्नु पर्नेछ ।
६. विद्यालयमा प्राप्त भएका प्रश्नावली सङ्ख्या भन्दा विद्यार्थी सङ्ख्या बढी भएमा Random Sampling विधिबाट तोकिएको सङ्ख्यामा विद्यार्थी छनौट गरी परीक्षण सञ्चालन गर्ने व्यवस्था मिलाउनु पर्नेछ । विद्यार्थी छनौट गर्दा छात्र र छात्राको अनुपात मिलाउनु पर्नेछ ।
७. प्रश्नावलीमा दुई ओटा खण्ड रहेका छन् । पहिलो खण्डमा विद्यार्थीको व्यक्तिगत तथा पारिवारिक विवरणसम्बन्धी प्रश्नावली र दोस्रो खण्डमा विषयगत प्रश्नहरू रहेका छन् । पहिलो खण्डका प्रश्नावलीमा निरीक्षकले विद्यार्थीलाई आवश्यक सहयोग गर्न सक्नेछन् । सबै विद्यार्थीले पहिलो खण्डको प्रश्नावली भरिसकेपछि प्रश्नावली यथास्थानमा राख्न लगाई ५ देखि १० मिनेटसम्म ब्रेक दिई सबैलाई एउटै समयबाट दोस्रो खण्डको विषयगत प्रश्नहरू (गणित, नेपाली र विज्ञानमध्ये कुनै एक विषयका प्रश्नहरू हुनेछन्) हल गर्ने गरी परीक्षण सुरु गराउनु पर्नेछ ।
८. परीक्षणमा सहभागी हुने हरेक विद्यार्थीको लागि एउटा कालो मसी भएको एकै किसिमको डटपेन विद्यालयले उपलब्ध गराई (विद्यालयलाई उपलब्ध गराइएको मसलन्दबाट खरिद गर्ने) सोही डटपेन प्रयोग

गरी उत्तर लेख्ने व्यवस्था मिलाउनु पर्नेछ ।

९. प्रश्नको उत्तर लेख्नको लागि प्रश्नावलीमा नै खाली ठाउँ दिइएको छ । सामान्यतया विद्यार्थीलाई थप खेसा उत्तरपुस्तिका आवश्यक पर्दैन । तर कुनै विद्यार्थीले थप उत्तरपुस्तिका खेसाका लागि मागेमा विद्यालयले नै उपलब्ध गराउनु पर्नेछ ।
१०. एउटा बेञ्चमा बढीमा २ जना मात्र विद्यार्थी बस्ने गरी बसाइ व्यवस्था मिलाउनु पर्नेछ ।
११. प्रत्येक विषयमा ३ किसिमका प्रश्नपत्रका सेटहरू (Versions) उपलब्ध गराइएको छ । गणितमा प्रश्नका किसिमलाई M1, M2 र M3; नेपालीमा N1, N2 र N3 तथा विज्ञानमा S1, S2 र S3 सङ्केत गरिएको छ ।
१२. प्रश्नावली वितरण गर्दा ३ ओटै किसिमका सेटहरू क्रमशः पर्ने गरी वितरण गर्नु पर्नेछ । (तलको चित्रमा गणित विषयमा प्रश्नावली वितरणको एउटा नमूना दिइएको छ । )

१३. विद्यार्थीले उत्तर लेखिसकेपछि निरीक्षकले प्रत्येक विद्यार्थीका भरिएको प्रश्नावली र उत्तरपुस्तिका दुवैलाई सँगै स्टिच गर्नु पर्नेछ ।
१४. प्रश्नावलीमा कुनै त्रुटी भेटिएमा प्र.अ./निरीक्षकले आफ्नो प्रतिवेदनमा सुझाव संलग्न गरी पठाउनु पर्नेछ, तर प्रश्नहरू सच्याउने वा तत्काल कुनै निकायमा सोधखोज वा खबर गर्नु आवश्यक छैन ।
१५. परीक्षण समाप्त भएपछि उत्तरपुस्तिका तत्काल खामबन्दी गरी छिटो र सुरक्षित माध्यमबाट जिल्ला शिक्षा कार्यालयमा बुझाउनु पर्नेछ । उत्तरपुस्तिकाहरू बन्द गरिएको खामको बाहिर प्राप्त भएका, प्रयोग भएका र प्रयोग नभई फिर्ता भएका प्रश्नपत्रको सङ्ख्या तथा विद्यालयको कोड उल्लेख गर्नु पर्नेछ ।
१६. उत्तरपुस्तिका सँगै प्रधानाध्यापक र शिक्षकद्वारा भरिएका प्रश्नावलीहरू पनि जिल्ला शिक्षा कार्यालयमा बुझाउनु पर्नेछ ।

**परीक्षण सम्बन्धमा थप जानकारी आवश्यक भएमा सम्पर्क:**

- शैक्षिक गुणस्तर परीक्षण केन्द्र, सानोठिमी (०१६६३९५५६, ०१६६३९५५७), email id: [eronasa@gmail.com](mailto:eronasa@gmail.com)

### **Annex 3: Scoring Guidelines**

#### ***Selected response (SR items)***

- Transfer students' response in each item in OMR sheets.
- If there are multiple responses of a student for a multiple choice item, do not transfer such responses in OMR sheet.

#### ***Constructed response items (CR items)***

- Participate actively to the orientation programme organised for scorers.
- Study marking schemes or rubric.
- Participate in the discussion session with the marking coordinators and experts at the marking centre.
- Judge twice the answers against the schemes and provide appropriate point.
- Consult marking coordinators and experts at the marking centre after making of with two answer sheets for their suggestion and confirmation.
- Provide whole number only (do not give scores in fraction or decimal).
- Transfer the score obtained by each student in OMR sheet after verification of score in each item.

# Annex 4: Background Variables Based on Students' Responses in Mathematics, Nepali and Science

Variable	Categories	Maths		Nepali		Science	
		Frequency	Percent	Frequency	Percent	Frequency	Percent
Student gender	Boys	7406	47.8	7081	46.2	7248	47
